HI RESOLUTION MONO MONITORS

T.U.S. 14" MONO

T.U.S. 14" Mono monitor for ST series. High resolution picture for Colouraid Monitor etc.

WITHOUT SOUND

£94.00

WITH SOUND (previous owners)

£109.00

ALL MONITORS INCLUDE APPROPRIATE CONNECTING LEADS AND A TILT AND SWIVEL STAND

TOS 1.06

TOS 1.06 is the enhanced operating system from ATARI for the entire ST range. Improved desktop including full keyboard control of windows, place programs on the desktop for easy launching, or assign function keys to launch the required program. Breakdown gives access to all TOS systems for complete compatibility. All bits supplied with full fitting instructions and kit manual.

STE VERSION 2.....£40.99

(TOS 1.03/3 (if supplied) Simple software installation)

SEPTM.....£14.99

New mailboxed out soon please msg.

HIGH DENSITY DRIVE MODULE

Exchange this ready with other platforms, by giving your ST the ability to read and write to high density (1.44MB) discs. Fully automatic, containing capability depending which type of disc has been placed in the drive. Comes complete with software drivers and high density formatting software. Top 1.4 or above required for high density support.

HIGH DENSITY MODULE.....£15.99

HIGH DENSITY MODULE AND 1MB DISC DRIVE.....£34.99

PARTS REPAIRS AND FITTINGS

NEW PARTS

Full 12 months warranty. All parts are tested before dispatch.

INTERNAL REPLACEMENT DRIVE KIT

For any ST with INTERNAL drive. High quality mechanism with standoffs for old ST's if required.

1MB or 2MB drive supplied.....£24.99

POWER SUPPLIES

New PLUG IN replacement, includes power switch and mains connector, no soldering required.

£20.00

386 CPU HOUSE

With free mouse mat.....£9.99

STEREALCON SPEAKERS

Stereo speakers with leads.....£10.99

HYD FROM CD ROM

REPAIRS AND FITTINGS

Fully trained engineers for a reliable repair. All jobs quoted for individually (no 'load' prices). 48 hour turnaround on most machines. Long 4 months warranty as standard. Courier collection and return available for £14.00.

We can fit any of the advertised products to your machine for a one off fitting charge of £15.00. This means that if you require any an upgrade and high density drive fitted then the charge is only £15.00.

Please ring for an appointment before bringing your machine or call if courier collection is required. Please ensure all parcels collected are adequately packaged.

TOS / HIGH DENSITY SPECIALS

STE TOS 1.06 WITH HIGH DENSITY DRIVE AND CONTROLLER.....£34.99

SEPTM TOS 1.06 WITH HIGH DENSITY DRIVE AND CONTROLLER.....£44.99

CHEETAH HARD DRIVES AND CD ROMS

THE CHEETAH DRIVE FROM T.U.S. DEVELOPMENTS BRINGS AFFORDABILITY AND STYLE TO ATARI SYSTEMS. SMALL CASE DIMENSION WITH BUILT IN POWER SUPPLY, COOLING FAN, DUAL SCSI INTERNAL CONNECTORS FOR DAUGHTERBOARD EXTRA DEVICES AND IN REAR PORT GIVES A FULLY FEATURED SYSTEM FOR USE ON MORE THAN JUST ATARI COMPUTERS. ALL SYSTEMS ARE SUPPLIED COMPLETE WITH BOST ADAPTER CABLE AND FORMAT / PARTITIONING SOFTWARE AND ARE PRE FORMATTED AND PARTITIONED READY FOR IMMEDIATE USE.

80MB.....£159.00

WE MADE IT!

Hi everyone! For so many it is... A.I.C.G. and I said:

"We decided that the best tactic employed on the cover was necessary to grab everyone's attention. Over half of you took out a three issue subscription, remembering with love and and if you don't, to subscribe this will be 100% last issue... but were planning to start around for a long time yet!"

The A.I.C.G. has demonstrated its commitment to the Atari platform and we all like to take this opportunity to thank each and every one of you for your support to date. In particular the contributors whose efforts have been appreciated.

Steps to the National of increasing or what has been an excellent enough in the future for the magazine to give everyone a consider taking out a six issue subscription. If enough of you do this we won't need such a short reminder every three issues and we'll be in a better position to develop the magazine and efficiently improve its long term management and planning. If your subscription ends with this issue, and you wish to continue receiving Atari Computing you will need to fill out the form on page 18. We will not be sending our nearest address... so check the top line of the label on the envelope this magazine came in to see when your subscription ends.

The Reader Disk continues to grow in popularity and we've started to collect addresses and names you can find everywhere else. On this month's disk we've included the Atari Computing database in ST Guide format, compiled by A.I.C.G. member Norman Hines. Take a look, Norman.

We're also delighted to introduce Paul Cheshire to the editorial team as online editor for our website. From the survey returns compiled by A.I.C.G. member Stuart Mison we know nearly half of you want a mention in its copy by the website.

All that remains is for me personally to welcome you to our third issue. We hope you enjoy it as much as we know you enjoyed the last two!

Joe Connor

Browser rumours

Just as the dust settles on the release of CAB v1.5 and the demo version of the Finnish Webpage browser, two later reports of another browser under development by Nordic Research Associates in the US. This is yet another browser capable of running on all Atari computers.

News of other browsers cannot overshadow the imminent release of CAB v2 which has undergone a major rewrite of the HTML Parser module to offer improved performance and an unrivalled combination of features including:

- Frame support, support
- Faster display of both text and images
- Support for many new tags
- Enhanced table support
- Solid support for external CDROM ability

Atari Ethernet at last?

Norbert Wozniak, the German developer of the (Atari II) SCSI interface has announced work is underway on an ethernet interface for the Atari platform which could be of enormous benefit to owners of several machines. The proposed specification is as follows:

- Connect via ACS/SCSI bus to all Atari computers using the ID address

- TCP/IP protocol to connect Atari to PC (Windows, Linux, UNIX computer)
- Usable under MINT and UNIX for Atari
- Drivers for CANS, MINTnet
- Interface should cost around 300,000
- I/Os: This ethernet (ENC) cable
- Network protocols include:
 - MIBCOM (Atari specific), TCP/IP and Windows network
- For more details contact:
 - Norbert Wozniak
 - Tel: +49 3309 943008
 - FAX: +49 3309 943011
 - URL: <http://www.norbert-wozniak.com/>

Our mistakes shirky?

Last time our printers said we was either been doted to the dark globe or been the grey fish down the edges of the page and product boxes. We decided to keep the doted in the globe, we ignored there were a much point having them otherwise. We didn't realise this would render the words in the product boxes illegible on most pages we have in the scene. Get your pens out!

We've taken precautions by changing the page design to prevent this from happening again. We also published the wrong telephone number for Holo. The correct number is +44 (0)1525 718181

Nordic Atari Show '97

This is the third annual get together held in Copenhagen and has established itself as a must for all Atari enthusiasts. The show will take place from Friday June 13th until Sunday June 16th. The doors will open at 1 pm Friday and close at 11 pm on Sunday.

***** 1996 *****

The exhibition hall will be for dealers, distributors and showroom programmers. There will be a cheap meet area where you trade items and a catering corner to hold these together and make repairs.

The backer hall will be hosted by the Nordic Atari Show who will look after other demo areas and programmes.

Stations on a variety of subjects will be held throughout the weekend along with more light hearted events such as the Atk on the Keyboard and Hard Disk Throwing challenge with prizes for the winners.

A three day pass costs 800,000 (around £150) with day passes at 600.

1997 UK ATARI SHOWS

Mike Lockwood, the organiser of the UK-based Atari Shows, has confirmed four Spring Atari Shows will be taking place in April at the venues as last time.

• **Wednesday 20th April:** National Motorcycle Museum, Birmingham - probably to the Computer Suite

• **Sunday 27th April:** Caterley Four Poles Hotel, London

• **May?** Possible Glasgow show although details still have to be confirmed.

Both shows will be open from 11am to 5pm and most of the exhibitors from the last shows plan to attend. Mike consistently expects some new exhibitors, of which more news to follow.

Atari Computing have a stand at both shows so make a note on your diary to show support for the Atari scene and tell us how to have what you'd like to see in the magazine. Even better bring along some articles or software we can use in the magazine!

Full details will be included in Atari Computing issue 4 but if you'd like to exhibit or register more details contact:

Tel: +44 (0)1753 531450

Fax: +44 (0)1753 531450

Afterburner 040

After the point speed injection added to a Windows upgrade has worn off you may also like to add an Afterburner 040 upgrade to your TOS 4.04.14600. An Afterburner 040 board equipped with an 48090-90 processor costs £495.00 including VAT (£404.00 ex-VAT). Features include:

- Microsoft 68040 producing 145.5/150MHz (Mac/CPX/Pipeline)
- Memory support further boosts performance to 15/16/60MHz
- Two 10-pin SIMM sockets for optional memory expansion up to 64Mb Fast-RAM
- Full-on bus bridge port for Expansio, Screenplay, PulsoSpeed etc
- MS/ROM Toolset produced by 685 16-control Afterburner settings
- Compatibility with Atari software

The Afterburner doesn't handle the Pulso case but then can offer the new C-Lab 885 X case for £109 including VAT (£93.36 ex-VAT) which are ideal for this purpose.

The addition of Fast-RAM increases the performance further with figures showing a 2.5 times speed increase over a standard Pulso with Fast-RAM and Memory incorporated.

Prices mentioned do not include carriage and Afterburner orders are batch produced so for more details contact: Tom

Music Maestro?

If you'd like to learn how to use your Atari to create music there are specialised courses being run at Glenshire Institute in Coventry. Training is free on Atari 512's using

Cubase, Cubase Creator and Sequencing Pro 39 along with some of the art 16 track digital equipment.

The course is accredited by CAN (Central Action Network) and on successful completion of the course students receive a certificate detailing their achievements.

The studio itself can also be hired by members to record their own music. So you can work your tracks up at home then bring them into the studio to polish them up before being recorded and mastered. For more details contact: Glenshire

Tel: 02493 133993
Email: Glenshire@uk.net or Glenshire@uk.net
Glenshire Productions, Upper Tyke St, Rarhead, Coventry, CV9 3DQ

Protext becomes back

Following the closure of Amore and the loss of the distribution rights for Protext have returned to the programmers who are now looking to develop Protext across a range of platforms. When asked recently about the readiness of Protext for the Atari platform, Protext co-author Mark Talley replied:

After a period during which Protext was not available for purchase, the Atari version of Protext v6.1 is now available again.

Protext Software is a partnership of four people including the original developers, Mark Talley and Gavin Emery.

The latest release is a consolidation rather than a major update (and is not significantly different from the earlier v5.6) but we have thoroughly revised the documentation for the first time since v5.6. We are working (although purchase) on v6 - more details in due course.

The release price is £45 - please make cheques payable to Protext Software. Because this is a new venture we expect, at this time, offer discounts or upgrades from earlier versions. However when v7 is released upgrades from earlier versions will be available. Brief notes are by mail order only. To place an order or for more details contact:

Tel: +44 (0)1862 737888 (Gavin)

NeST problem

Just before we went to press, news reached us that all computer equipment belonging to Dorcas

Brownell has been confiscated by the police. Dorcas is the coordinator for June 95 - NeST Control Control. This is the top area where NeST (the international online Atari users network) traffic is collected and passed on to Atari users worldwide. Despite the loss of equipment including the main server, users are currently under way to provide an alternative NeST backbone. Hopefully normal service can be resumed without difficulty.

Atari Music File/Gig

This show is planned for 2nd May 1997 at the Crown Court Hotel in Lutterworth. All artists using Atari hardware/software are invited to attend and play from 12am till 11pm. If you are interested in attending or playing contact Gerald McCall on +44 (0)1453 218855.

WebSphere, the HTML creator under development by Simon Conrad now has a description from the 'Home Page People' as HTML creator currently at v1.8 by German and for his Dutch blog who got the inspiration for the program from HomePage Wizard on the PC. Matthew has also programmed several other useful looking Internet utilities. For more information point your browser at: URL: <http://www.blakehale.de/~blakehale/program.htm>

Craft Soft changes

Craft Soft Software has launched its new web pages which includes details of its games including Mode Mayhem and the latest news about the Atari Tapes club magazine 'Contact'.

or Tel: 01846 855 05-06/07/08

SURVEY CONCLUSIONS

The survey is now being collected by Martin Miller with conclusions by Martin Miller and Joe Cusum.

First of all thanks to the 314 readers who sent in their survey forms. 30 respondents found the editorial style too simple. 14 found it too complicated and the remaining 309 thought it was about right. 8% wanted free or paid Reader ads.

Requests for more Tutorials, DTV and Q&A's have been duly noted. The most popular sections of the magazine were News, Reviews and Tutorials. Although some people own computers than read the number of respondents online and interested to compute is higher than any previous survey of Atari readers.

The most popular application was (unsurprisingly) word processing followed by graphics, games, database, communications, DTP, music and programming spreadsheets and education in that order.

Respondents collectively own 517 computers with less than 2% using emulators. Despite the legendary unreliability of the 68K range over half the respondents use an ST or Mega ST's - game programmers take note!

Around three quarters of users have used Atari machines for at least five years with only a handful of users still struggling with less than 1Mb of memory and floppy based systems which means we can turn our attention to screen displays. Almost half of the respondents are using colour monitors or TVs, presumably to reduce resolution. We'd encourage you all to add a mono monitor - leaving colour for games sessions. ST mono resolution is much easier on the eyes and will enhance your enjoyment of Atari computing domestic life!

Nearly three quarters of respondents use TOS with a surprisingly high number of people using MultiTOS. Despite its almost universal acceptance amongst power users, Magic has not replaced TOS as the OS of choice but is clearly more popular than Geneva. Added together around 25% of respondents are multitasking.

Although the largest group of people heard about Atari Computing online we gave Floppyswap a pat on the back for their efforts promoting the magazine.

Attend

System Builders Insurance never lost our products. IT Format stopped a trial reinsurance dispute by destroying page covers, but finally the suit moved to court. IT Format was closed at issue 66 in September—however, we don't bother.

Within a few days the actual endorsement on CTR was playing a replacement and I enjoyed watching the plans take shape. It is a tribute to Mike Kevlahan, Joe Connor and the rest of HCC's that the first move was ready to make its debut in the market. Alan Shores last September and shared the description of the A/C's here to the A/C's network.

IBM entered well and with some modified products in the pipeline (spare parts) planned new P/PS/Measure releases and several standard disk magazines IBM could be the last one over! All it needs is active support for the magazines commercial companies and P/PS/Measure number 1 and we can keep this platform alive - wherever machines you run it on. With every subscription, purchase and registration you help us grow this platform. Because I propose at least in the short of this case future.

Local cluster marketing conference

our Reader thinks will always contain the best software available, along with items not available anywhere else. We decided against a For sale page because we feel the gap between buyers is too long and the content would be outdated. We recommended getting online to your local BBS where those change boards regularly at available prices.

You are off to a great start on the position of *ST Reviewer*, and Alan Ropald I suggest you spread the message for quality and quantity of articles rather than for best content, as this is not the time.

[illegible]

I put two envelopes in the post this morning. Both A4 size, one brown and one white. I opened the white one first. It was the French Internet *Elle* magazine. I skimmed through it and although vaguely interesting it quickly got bored and ignored. The brown envelope

When a classroom 64 pages contained with relevant A&U-involving articles for only \$30 I cannot put in a word of the gratitude I feel to the team of the A & U for starting this mag. except thanks and a highly long I have just appeared my life in this, a real will need support to blogC and stick with the A&U platform. I become greatly influenced by A&U Committee

I really enjoyed the *WASHPOST* article. It is so badly mismanaged over its page size it splits the second line into two. I must have a new-watching system for watching *WASHPOST*. More articles on collecting our systems please!

Steve, International Conference C

It was a brave decision to go along with a lame Alan Maynard, especially after two bad seasons past to the wall and you have my grateful thanks for doing so. Auri Compagno is, fortunately, replaceable with a good rational hire. Why aren't FC supporters writing to a similar manager? I found the articles on weekdays and BBC to have 10 paragraphs everything and at least someone has explained what the various numbers of teams mean when you're (un)conformally creative. I wish you a happy new year and merry Christmas to all associated with Alan Coombe.

1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, 2465, 2466, 2467, 2468, 2469, 2470, 2471, 2472, 2473, 2474, 2475, 2476, 2477, 2478, 2479, 2480, 2481, 2482, 2483, 2484, 2485, 2486, 2487, 2488, 2489, 2490, 2491, 2492, 2493, 2494, 2495, 2496, 2497, 2498, 2499, 2500, 2501, 2502, 2503, 2504, 2505, 2506, 2507, 2508, 2509, 2510, 2511, 2512, 2513, 2514, 2515, 2516, 2517, 2518, 2519, 2520, 2521, 2522, 2523, 2524, 2525, 2526, 2527, 2528, 2529, 2530, 2531, 2532, 2533, 2534, 2535, 2536, 2537, 2538, 2539, 2540, 2541, 2542, 2543, 2544, 2545, 2546, 2547, 2548, 2549, 2550, 2551, 2552, 2553, 2554, 2555, 2556, 2557, 2558, 2559, 2560, 2561, 2562, 2563, 2564, 2565, 2566, 2567, 2568, 2569, 2570, 2571, 2572, 2573, 2574, 2575, 2576, 2577, 2578, 2579, 2580, 2581, 2582, 2583, 2584, 2585, 2586, 2587, 2588, 2589, 2590, 2591, 2592, 2593, 2594, 2595, 2596, 2597, 2598, 2599, 2600, 2601, 2602, 2603, 2604, 2605, 2606, 2607, 2608, 2609, 2610, 2611, 2612, 2613, 2614, 2615, 2616, 2617, 2618, 2619, 2620, 2621, 2622, 2623, 2624, 2625, 2626, 2627, 2628, 2629, 2630, 2631, 2632, 2633, 2634, 2635, 2636, 2637, 2638, 2639, 2640, 2641, 2642, 2643, 2644, 2645, 2646, 2647, 2648, 2649, 2650, 2651, 2652, 2653, 2654, 2655, 2656, 2657, 2658, 2659, 2660, 2661, 2662, 2663, 2664, 2665, 2666, 2667, 2668, 2669, 2670, 2671, 2672, 2673, 2674, 2675, 2676, 2677, 2678, 2679, 2680, 26

Just when I thought the world was ending I opened my copy of *Asat Computer* and traveled through the letter box. Many warm congratulations and thanks to the team that produced this glorious publication for our benefit, deserves the highest praise and support. May all subsequent issues be as greatly packed with goodness. Never mind recycling-type paper or other expensive embellishments.

Charles E. Abshire, Abshire

There's nothing more up the AICPA's sleeve, and really, makes us feel our efforts are worthwhile, please do keep the us coming.

In 1980 we restored a program called *Dumped* to the *PCMagazine* website. Could you please inform me of how I can obtain this program? Thank you for a very interesting and informative magazine much needed. Sincerely, Bob Williams

Wiley-Interscience, Inc. (John Wiley & Sons, Inc.)

Most of the software reviewed in the FOAMware section is available from Floppypops, Commodore and LAPD. However, visit the Advertisers Index on page 33 for details.

Gradually we review software which is only available on our Brevity Disk and there can be reviewed individually, either in the Brevity Disk menu or directly.

In most cases the reference is also available from online services, on the Internet. It's always worth checking our web pages or logging into CIBIS.

1000

A Although I have had my Atari for several months, I have not yet got to grips with it. I'm a complete beginner, never having used a computer before. In fact, to be honest, I am a bit scared of it and really need an Atari guide to the Atari 1100s that you must use to help.

1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, 2465, 2466, 2467, 2468, 2469, 2470, 2471, 2472, 2473, 2474, 2475, 2476, 2477, 2478, 2479, 2480, 2481, 2482, 2483, 2484, 2485, 2486, 2487, 2488, 2489, 2490, 2491, 2492, 2493, 2494, 2495, 2496, 2497, 2498, 2499, 2500, 2501, 2502, 2503, 2504, 2505, 2506, 2507, 2508, 2509, 2510, 2511, 2512, 2513, 2514, 2515, 2516, 2517, 2518, 2519, 2520, 2521, 2522, 2523, 2524, 2525, 2526, 2527, 2528, 2529, 2530, 2531, 2532, 2533, 2534, 2535, 2536, 2537, 2538, 2539, 2540, 2541, 2542, 2543, 2544, 2545, 2546, 2547, 2548, 2549, 2550, 2551, 2552, 2553, 2554, 2555, 2556, 2557, 2558, 2559, 2560, 2561, 2562, 2563, 2564, 2565, 2566, 2567, 2568, 2569, 2570, 2571, 2572, 2573, 2574, 2575, 2576, 2577, 2578, 2579, 2580, 2581, 2582, 2583, 2584, 2585, 2586, 2587, 2588, 2589, 2590, 2591, 2592, 2593, 2594, 2595, 2596, 2597, 2598, 2599, 2600, 2601, 2602, 2603, 2604, 2605, 2606, 2607, 2608, 2609, 2610, 2611, 2612, 2613, 2614, 2615, 2616, 2617, 2618, 2619, 2620, 2621, 2622, 2623, 2624, 2625, 2626, 2627, 2628, 2629, 2630, 2631, 2632, 2633, 2634, 2635, 2636, 2637, 2638, 2639, 2640, 2641, 2642, 2643, 2644, 2645, 2646, 2647, 2648, 2649, 2650, 2651, 2652, 2653, 2654, 2655, 2656, 2657, 2658, 2659, 2660, 2661, 2662, 2663, 2664, 2665, 2666, 2667, 2668, 2669, 2670, 2671, 2672, 2673, 2674, 2675, 2676, 2677, 2678, 2679, 2680, 26

There's no reason to be scared, *Steel* maintains us as friendly as companions get. We do try to do as much harm as we can, but we're happy to answer specific questions through the Q&A pages and occasionally between issues the best way to get help is a day or two back to us get a message, follow our "Web" section, and get online to us on local BBS.

Thanks for *Adul-Conspiracy*, which is both welcome and interesting. The covered topics and content is well balanced and I hope you can keep this balance in forthcoming issues. My only reservation is the shorter title choice.

The last two ST Format disks contained duplicates of programs I already had from MI libraries. Please print plenty of letters and Q&A pages and if possible send a regular Post sale volume. When ST Format checked I almost sent you a PT, with all the rules, and learned more it would take to get back to square one! Adad Computing has closed as a great relief and I wish you every success.

Table 1

Our Reader disks only ever include the very latest versions of programs. Our disks contain directly with the best Agri-programmers around the world's money.

Methodological Issues, Research, and Practice

[illegible]

1996 I started my Computerized taking course for software and hardware products that consist of all of these items. World's biggest selling software I was truly saddened.

World's Fastest TOS Compatibles

How Fast
do you want to

Direct
60

Direct
40

Go Today?

Do You Need More Speed?

Direct 60 and Direct 60 are fast and these new from TT60. Compatible will satisfy even the most demanding need for speed. Direct 60 is compatible and designed for processor intensive tasks such as Desktop Publishing, Image Editing, Ray Tracing, Rendering and Database Management as well as high speed word processing. Direct 60 and Direct 60 will increase your productivity!

Just How Fast Is It?

Direct 60 is based on the 133 MHz MC68060-68060 processor providing the speed and power of all Direct 60. The new Direct 60 is based on the 26 MHz MC68060-68060 processor offering the speed and power of a 133 MHz processor in an example. In rendering, for example, it takes 4 hours on a T60 (Direct 60) to do the same work as a T60 (Direct 60) to do the same work.

How easy is it to expand?

Direct 60 and Direct 60 are designed to use PC, 133 MHz compatible graphics cards, VGA or PCI graphics cards, 100 and 133 MHz hard drives, keyboards and standard PC components. Direct 60 is designed to be a 133 MHz system with a 133 MHz Pentium or Pentium Pro processor. Direct 60 is designed to be a 133 MHz system with a 133 MHz Pentium or Pentium Pro processor. Direct 60 is designed to be a 133 MHz system with a 133 MHz Pentium or Pentium Pro processor. Direct 60 is designed to be a 133 MHz system with a 133 MHz Pentium or Pentium Pro processor.

What about Compatibility?

Direct 60 compatible have always been known for their high degree of compatibility. Direct 60 and Direct 60 follow the path of higher speed with excellent compatibility. Generally, if it runs on a T60 (Direct 60) it will run on a Direct 60. Direct 60 is designed to be a 133 MHz system with a 133 MHz Pentium or Pentium Pro processor. Direct 60 is designed to be a 133 MHz system with a 133 MHz Pentium or Pentium Pro processor. Direct 60 is designed to be a 133 MHz system with a 133 MHz Pentium or Pentium Pro processor.

Complete Systems

Complete Direct 60 and Direct 60 systems include 486/586, 133 MHz hard drive, 100 MB floppy drive, 1 MB DRAM, Graphics card with VGA, 133 MHz keyboard mouse and are installed in an attractive Mini Case. Also includes Direct 60. Direct 60 is a special kind of software. Options can include larger hard drives, CD ROMs, more memory, removable drives and more. All Direct 60 computers are built to order allowing for custom packages. Call us for your personal computer.

Freedom 2

Freedom 2 replaces version 1, which it is, but it has another meaning.

Freedom 2 runs, performs, and behaves in parallel to version 1, like exterior and interior regulations. In addition to standard Windows controls, it has a Freedom Panel (Options-Freedom 2) installation is now eCPX (Extended Control Panel) extending standard along with a copy of the look and configuration eCPX.

I can already hear people moaning: look at all these... in which I respond with one word: Memory. On average, the computing Freedom 2 with version of 30 and Standard there is a string of around 3000-3400.

configured with Standard and 30MB with eCPX.

For other Windows applications, Freedom 2 can open as many eCPXs as required, all in separate windows and all multitasking. However, in addition Freedom 2 offers eCPXs which replace eCPXs, are not restricted to Standard, and windows, instead of updating features into multi-page eCPXs, a single window eCPX could be group added instead.

Selecting any eCPX from left clicking on the selection buttons options not located in other Windows applications. An individual option opens the eCPX window after Freedom 2 has finished loading and another option shows the window position and re-displays it at the same position. It you like the 3D look you can even have eCPXs to be displayed in 3D, which means most of the time but can be toggled off for individual eCPXs. It you encounter the display problems, finally the individual eCPX tags mark as the window and read only tags can be set as desired.

Like the eCPXs Standard replacement Freedom 2, work together with a suitable replacement desktop also runs eCPXs, and eCPXs, a by-double-clicking on them without opening the Freedom 2 window. Under eCPXs the selected control panel now immediately without, extending other installed, except panels open.

Since eCPXs are supplied with Freedom 2 there are others in the package: Multitasking, Troubleshooting, Freedom 2 Config, and Windows.

Modification

Modification is a MOD player supplied to help remove the version supports the Digital signal Processor (DSP) chip, only available in Philips machines and in other version is designed for owners of 90s machines.

Troubleshooting

1 trouble provides a help system similar to the built-in help found on the Mac and under Windows95. Holding the mouse

Key Boardworth previews Freedom 2, the Rolls Royce of file selectors on any platform?...

pointer down over buttons and icons in supporting applications displays a pop-up bubble along with a brief description of the selected item. Details (generally only in German) are included so programmers can implement bubble help inside their own programs.

Windows

The key of eCPX adds fully-configurable real-time window actions to your system, similar to those provided by Win Commander and WinA. Its cloning and moving windows using the right mouse button is performed in real time and the action is only executed once smoothly than either WinA or Win Commander in any platform.

Freedom 2 Config

Freedom 2 can be configured without getting your hands dirty inside a text editor which displays the most features in Freedom 2. Every aspect of Freedom 2 can be configured from this text-based menu eCPX split into sections:

General

Settings that affect the whole program. Options include how alerts are displayed how drag and scroll actions behave along with options to decide how Freedom should behave when it's in the background.

Freedom

Set what file folders should be opened with a single or double click, whether a single or double click displays anything, a double-left click or shift-left click, set how the cursor starts when it gets to the end of a list.

should it wrap back to the top or simply wrap? There's even an option to set the height of popups relative to the screen height.

Links and more links

These two sections determine the look and feel for the windows. The former used to call Windows and paths to the Clipboard which sets the window window system which way loaded the OS and Control buttons appear and so on. You can even 3D each individual Windows if you like!

Paths

This section sets the default paths, marks and defines some shortcuts. Up to help buttons a key short-cut can be configured and they're easy to define. A popup contains every available option in display.

Lists

Set how Freedom reacts to programs using the file selector. Some older programs use old file protocols while Freedom is based on newer protocols. Most systems. Options to give Freedom and call the file selector in all Freedom, modify or even modify are available.

Freedom 2, a cool feature update! A look at the options in the configuration eCPX should be enough to convince most people to upgrade. I have described Freedom as the Rolls Royce of the selectors. Freedom 2 doubly deserves the title: automatically at 200 was a requirement via Internet, a new has a price tag to avoid forcing every one upgrade to 200 or why not check out the demo version and decide for yourself? ☺

© Freedom 2. Notice the file selector panel selection, and the 3D look given to the File General eCPX.

The One Stop Font Shop!

For years buying just the typeface that you needed has been inconvenient and costly. Atari users have not had the luxury of large on-demand type libraries that PC and Mac users have enjoyed. For the average Atari user finding the typeface that they need usually meant a call to their local PD library. Once there they had little choice but to buy large collections of fonts on disk, in the hope that one would be useful for their job.

Introducing.

FONT

Now Atari users have a typesetting source that will build into the only place to buy fonts for their applications. Using the PC and Mac type libraries as a model this catalogue offers the user an easy means to buy the typefaces they need. The advantages are clear:

- Choose just the font that you need. No more buying dozens on disk that you may never use.
- Buy one or the entire collection. A1 £1 for the PD fonts, the price allows the user to buy as many or as few as they wish.
- All fonts are in Colamer's CPM format, the closest to a standard they've have. Each typeface has been checked and built into Colamer version 1.0a.
- All PD typefaces have at least the minimum of 'Upper and lowercase letters, full set of numerals and basic punctuation'. The user does not have to modify the font in any way, or add missing characters.
- Fast conversion service for one-off jobs as needed.
- Font Club. The catalogue will be updated on a monthly basis. At least 10 new fonts will be added each month. New catalogue pages will be issued to all registered users of the catalogue. Purchasers of the catalogue receive one full year of Font Club membership saving them £10 on the usual membership fee.

Font frustration

If it isn't right now I'm so used to not collecting one of my first software purchases was Timeswisk DTP followed by as many more (DTP fonts as I could afford. When I moved over to Windows I started all over again this time collecting CPM fonts.

Collecting fonts is the easy bit, being able to find one when you want it is a different matter. FreeType reference pages provide quick and easy access to your hard and especially if you undertake a commercial work, a reference clients can use to select fonts.

Watching a typewriter supplied by a client can be frustrating and time-consuming. I'd always wondered if there was a better way and recently one such solution arrived on the Atari arena.

David Howell of Walnut-based Minus Publishing has recently launched a new online font catalogue and hot desk service dedicated to taking the hassle out of font finding.

The Font House service involves buying a hefty 100-page printed catalogue of all the fonts currently available from Minus, along with the entire PostScript 3.0 font collection. The catalogue costs \$12.95 which includes one year's membership of the Font Club. Thereafter an annual fee of \$10.00 is payable. Effectively the catalogue is free!

Club members receive a monthly mailing of new catalogue pages. Minus plan to release ten new fonts every month. Each new font costs \$1.00 each - the same price as the majority of the existing PD fonts in the catalogue.

A large proportion of the catalogue is devoted to CPM format, display fonts but there are still plenty of font families which offer hair, bold, light condensed and other variations on the basic theme. Font families vary in price depending on the number of fonts in the club.

The catalogue itself is nicely laid out in A4 size format with cross references to the alphabetically ordered fonts which makes finding your way around pretty painless. Each

Can't find a suitable font to use in your masterpiece? Mike Kerslake finds a possible solution...

individual font has its own section including a list printout of all available characters - so you see exactly what you are buying before parting with your money.

Minus points out many of the fonts with the exception of the commercial STC ones are shareware and a further payment might have to be made to the font designer. Minus accompany such fonts where required.

provide a relatively cheap, albeit partial solution to this problem.

Since the introduction of Speedo TrueType and PostScript fonts on the Atari platform the use of CPM format fonts has declined so I was pleased to hear Minus are making progress on a TrueType edition of the catalogue. A TrueType compiler and font service would be a welcome cross-platform service and I look forward to developments on this front.

In conclusion, the catalogue and font service also is a good one although perhaps several years too late for many Atari users. If you have a small CPM collection and plan to

FONT

expand it substantially, this is the place to start. If you already have a large CPM collection, you probably won't find many new fonts here but as a reference index it is still a lot less hassle than poring over your catalogue.

I have one reservation. For the cost of such Font House fare I could order a thick list of fonts from a PDShareware library. However, having to wade the time and effort required to put together such a well produced, easy-to-use catalogue and its secondary use as a guide to existing collections (the Font House catalogue and service are both well respected).

own insight. It is not easy for virus detection software to get to grips with. After a night involving the usual quantities of blood, sweat and tears (and lots of disks deleted) for test purposes) UVE was finally able to recognise all possible manifestations of the so-called 'Phanatic Virus'.

Seize the day

The next day I was finishing up the updated release version of UVE, when I remembered another archive I'd been with recently. The archive supposedly contained a new lock status (see below). Over the years I've

tried to date and thoroughly reworked the Ultimate Virus Killer. It is now available in its on-line shopware version.

received dozens of issue messages, notices and disks like these so I expected this to be another one to add to the list. I sat about carefully analysing the ZIP archive's contents and after several minutes let out a heartish sigh: as my hard disk became infected by a virus I hadn't even noticed. But a brief moment the next. Both Maren Development Inc. (Dedicated to the memory of Lucky Lady) Remote customers. Here nothing. Lucky Lady was a particularly

infamous creator of viruses and I broke out into beads of sweat when thirty seconds later the text 'NO!NO!' appeared at the top left hand side of

trying to classify my own system and then trying and find out exactly how this virus went about its business. It eventually became apparent a file called 'CARPE DIEM PRG' was a Trojan program - a so-called 'Trojan Horse' which installs the virus in the computer's memory. Indeed my floppy currently in the disk drive and written in the hidden file called 'PRG' into the Auto loader of hard disk partition C. Hidden files are normally deleted by changing the program header flags from the desktop. In the same way files are made 'Read Only' for the time being, contain most activities are once again in step with the threat. To eliminate this virus completely it is necessary to remove all instances of virus infection.

My screen and my computer flashed shortly afterwards!

I spent another night spent feverishly looking at the computer, finally

However, when booting with an infected floppy disk the virus would re-install the hidden 'PRG' file onto the hard disk and booting with a clean floppy disk the hidden 'PRG' file on the hard disk re-installs the floppy again. Either copy of the virus infects

CARPE DIEM WARNING
This Carpe Diem Virus originates from a ZIP archive called 'CARPE DIEM ZIP'. The archive contains a file called 'CARPE DIEM PRG' (91758 bytes in size) and a small text file reading: 'Seize the day and run this great (almost enhanced) game! (sic) Upon running this game, your electrons may spot the text 'Both Maren Development Inc. (Dedicated to the memory of Lucky Lady)' displayed briefly before the Desktop disappears and the virus is now (auto) in memory and on the floppy disk currently in the drive. There will be a small hidden 'PRG' file in 'C:\AUTO\ and after around forty seconds, the text 'NO!NO!' appears at the top left side of the screen to signify the virus has been activated and causes both Windows and OS systems to crash repeatedly.

Do not de-archive any ZIP files called 'CARPE DIEM ZIP'. Do not run the program 'CARPE DIEM PRG' contained in it!

Ultimate Virus Killer v5.0 is able to recognise and can help you get rid of this virus completely and includes step-by-step instructions explaining how to classify your system and hard disk.

1) Carpe Diem: seize the day, might be all the time you have left, seize this virus instead!

the computer a memory and either re-installs the virus again as required daily!

I wonder what the next virus trouble will bring?

For now at least UVE is once again up-to-date. To be continued! ☺

Xav flips the lid on his Jaguar CD and discovers, like many reviewers before him, graphics alone are not enough...

Dr. Mearns

Dr. Mearns (Mearns): "You can't see all those mad, disembodied wheeled-on guys? Look on taking over the world, are you?" How did you know?"

Man, I've played a lot of video games. So speaks Lance, the hero of Braindead 13. Unfortunately while he may have played a lot of video games (a serious his creature fans!) - well, not highly playable ones, anyway.

For those of you with previous experience of them, it will suffice to say this is a Ready2Go game. For the uninitiated, or those with poor memories, Ready2Go were responsible for ST titles such as Dragon Lair and Space Ace. These are also available for the Jaguar CD, and plotless and graphic details aside, this review of Braindead 13 would do for all three!

This seems a little unfair but, from the player's perspective, it is essentially true. The gameplay in all three games is identical, consisting of a series of cartoons linked through the player's actions. This would be fine if the player had some choice over the actions to take, but as any given circumstance there is only one right way to escape. The game boils down to little more than a test of memory and timing, and is made even harder

by the inability to take out of a particular situation having you to repeatedly watch Lance being killed when you try each of the combinations in turn.

Fortunately for I guess death isn't much of a limiting factor in his death around Dr. Mearns' castle, because he has

links (the which turn the game into a test of endurance rather than skill. It can be hard to tell whether you are actually getting closer to the finish, or just running round in circles.

Fortunately you can see your position in the game at any time - if you have the Memory Trunk cartridge (don't even think about buying any of these games if you haven't, because these are not the kind of games you can enjoy playing from the start each time).

The aim of the game is to make your way around the labyrinth of rooms and passages which make up the castle, avoiding Dr. Mearns' henchmen, Felix, and a host of other hazards and dead-enders who are intent on killing you in the most imaginative of ways. Undoubtedly you should find yourself entertained with Felix before meeting up to do battle with Dr. Mearns himself. Sadly the most novel of scenarios (but actually quite a refreshing change from the over common ones which seem to accompany most games these days

Not quite Tom & Jerry

So is there actually anything to recommend Braindead 13 to the game starved Jaguar CD owners out there? Well, actually there is. For a start, there are the graphics, when I described them as 'cartoonish' earlier on, it was not without good reason. They are beautiful to look at, despite a case of the jaggies due to lack of aliasing, and the introduction alone is worthy of a space on Wolf's Cartoon Tree.

Even the gameplay is beautiful in most parts - although there are a few sections where you need to remember far too many steps to complete them. My main criticism here is that the moves you have to make are not necessarily those that seem desirable given the layout of the rooms and with the exception of some pathless in passageways, there is no real choice of moves.

Despite such things, the real fun of Braindead 13 comes from the myriad ways in which Lance (who became a disturbing reminder to myself) can be killed. Each manner or situation

has its own method of finishing him, and most of them require wit and imagination - and all gloriously animated. Whilst the violence is a symptom of the cartoon nature, it is a slight step above Jerry the Test with a trying gun, and of no includes decapitations or bones being unnecessarily extracted. It is not that disturbing, but if you expect the game to be played by a young child, it may be worth checking it out for yourself first.

Having said that, I would suggest doing your best to try out this, or another Ready2Go game before buying it. It could be said that everyone should own at least one of these games, as they represent a unique genre that really shows, graphically at least, what can be done with modern technology. Of course, it also represents a rather expensive and frustrating way of watching a cartoon so try it out and decide for yourself whether interactivity is really worth the price of three Drive-in videos. **D**

Thinking over the world would be only a few hours more as he'd be control as Lance

Oases

Frank Charlton revisits this cross-platform operating system...

Changing platforms has been an issue close to the hearts of Atari users for several years now. In an ideal world, every computer would be capable of running the same programs. We're not talking about a global corporation allowing their system down our throats; just a dream level of interoperability between platforms. Reginald Digital Logic thinks so too, and was the first behind Oases.

OMG! at Oases?

Oases is an operating system which runs across multiple computer platforms. The idea is very software

written under one version of Oases should run instantly on any other version. Originally Oases was released as OMEs, the Open Multitasking Environment and Emulation System, development on the PC, Mac, Amiga, and Atari platforms. Currently Amiga and PC development seems to have stalled, which somewhat dents the early aspirations.

Oases is an operating system, just like DOS/MS-DOS and Mac/PC. In fact, Oases doesn't run Atari software at all. Software has to be programmed specifically for Oases, which brings us to the last major obstacle. For Oases to succeed as a true cross-platform solution, software authors on the PC and Mac, especially the world-dominating PC, would need to

re-develop their legacy applications from scratch. Without several major new applications Oases is doomed to remain a curiosity.

Slippy Windows

Oases runs under a graphical windowed system, similar to XWindows used on UNIX machines and looks nothing like DOS. The basic desktop has no drive or program icons, everything is controlled via the Oases File Manager. To open a window containing a drive's contents you click on the 'Disk' button in the

Manager. Likewise programs are launched by clicking the 'exec' list display offered by Manager windows. To open a document you either have the choice of clicking the file itself

to launch the parent application or pulling up the file from the Manager window and dragging it into the open window of a program you're already running. This drag and drop system makes file selection redundant but it is difficult to get used to. Windows can be closed and moved as with GEM but without those icons and title bars it can get confusing.

The core of the Oases system seems stable, providing a solid working environment but the fly in the Oases ointment is obviously software, as rather the lack of it. When I first looked at Oases years ago it included a few simple applications, a basic guest program, a word processor and a few file conversion utilities. Years

later they're still there but several of all none of them come close to holding a candle to current Atari equivalents.

Multimedia Mayhem

The one major addition to the Oases stable is called Interactive Author. Basically it is intended to be a multimedia development system and also create Interactive Textbooks for educational

as home use. Each book can contain text, sound, video footage. Ultimately a program to create your own using the 'Mini' digitizer is supplied and Hyperlinks is being developed. Although Interactive Author is due to play around with a Oases 1.0 beta, any new ground and you could create more stylish than cross-platform documents via a basic RT using HTML and a copy of CMI.

Oases is a brave attempt at solving the thorny question of cross platform compatibility. Unfortunately the slow development, it seems as more advanced than the old OMEs ever was coupled with the slow software available is likely to kill any hope it ever had of succeeding. Oases has not significantly penetrated the PC and Mac markets which means it is an instant drag candidate rather than a serious alternative to any of the established operating systems. ☹

Interactive Author is used to create multimedia documents. It's easy to use, but lacks power features.

The fly in the Oases ointment is obviously software, or rather the lack of it.

☹ The basic Oases Desktop offers windows like GEM, but no drive or program icons.

Commit to memory

The Atari community has always had a reputation for being a little off the PC world. On the one hand we have lost thousands of users and dollars of our own programs, to the glorious violence which permeates and helps drive some of the best computing. On the other hand, the growing popularity of the PC has seen the price of peripherals dropping rapidly as vendors continually try to undercut each other in a market which has too many players.

For Adept (2025), this last format change makes the printers somewhat less driven and CD-ROM players become most of them. CDs also be used on Adept machines. With Windows 95 requiring at least 16MB of memory to run smoothly the price of memory has also been decreasing recently.

The memory on PCs commonly takes the form of Single In-Line Memory Modules (SIMMs) which provide a simple and modular upgrade path using components which are broadly compatible across most platforms. 30 pin SIMMs can often be packed up cheaply as PC memory sticks to 16MB. SIMMs are also perfect for use in both SBC and VME modules using available slot and bus formats.

Although the 51 survey cannot accurately track through the data measure barrier, the Fabian can account up to 14 bits directly using one of the two levels of Fabian assessment, while it is possible to move beyond this limit, but relying on other means. I pulled for this the conceptual aspect. And typically, the system is not to use 5000 randomly selected events for their own proprietary designed board. Naturally, the problem can be possibly exacerbated with various third party manufacturers, including adaptive boards to monitor the non-standard data connected to accept standard 5000s to reduce redundancy.

[illegible]

Yes, there may be some appealing to others. For many users the thought is simple and we like the idea of having a monitoring and operating system that can handle the management of business, you can find more information with other users to work for your productivity. If you are in this category and thinking of upgrading it, I will work following the price of memory as it fluctuates widely from month to month and then you can purchase around the \$100.

Another consideration about RAM is that it should be available to upgrade to 1GB or around \$100 in practice. The PC world is really with slightly different memory variants, each with 4 times greater bytes so, before you know exactly what you're buying it is a mistake to say that the board and RAM together form an ideal supplier and also around 1 purchased since then. This Design of just under \$100 but one consideration is that you can't

This upgrade, as supplied, had the 2000 already fitted and simply required the removal of the old memory board and its replacement with the new one. The job is simplicity itself, which is good, because as instructions were needed, even a fool could do it.

Xav explains why he finally took the plunge and added more memory to his Falcon...

Nothing more than the removal of a few screws from the casing and shuffling out the subsequent swapping of the boards. Trading the installation is just as easy simply turn the machine on and let it perform its built-in memory scan.

There are a handful of applications which claim to take 16-bit data, but for the most part the problem will go away as the applications are updated. Microsoft's *Access* never more than a few usual *Access* files. I suspect they might have something to do with the number of apostrophes I can use here having automatically changed the path to and through the root and I have a few minutes left with a computer that has a copy of some of my Windows 95 executables. I'm in a bit of a state of a high tension, using development tools with MSN's updated scientific tools and long Windows commands through the *Visual Basic* and *Access*. The computer

[illegible]

besides to say I am extremely pleased with the upgrade and its being at the price of \$1000 less I got through the deal since I wrote this I recommend upgrading to anyone running out of there as well as a really nice looking system.

After being captured and held in an underground base you've escaped! A guard and equipped with a gun. Your plan is to get to the center of the complex, destroy it, and save humanity. In case you're left in any doubt this is another Doom clone.

Attacking creatures are not 'in your face' enough to be scary and the weapon sticks halfway up the screen so it looks like you're always aiming too high although I did get used to it eventually. Sometimes the weapons seemed to

Destruction imminent?

Martin Milner's efforts to escape this 3D action game seem doomed...

Destruction imminent is supplied on a single floppy disk along with a clear A4 wallet with eight pages booklet explaining the controls, and game resources along with hints and tips to get the most out of the game's rich touch. Both joystick and mouse key controls are supported although some actions can only be performed via the keyboard.

The game has to be auto-booted from floppy and cannot be run from the desktop. After displaying its title screen the data-overhead style intro music is loaded and played - a preloading start if you want long enough other screens describing the scenario and profiles of the various components of the game along with their attributes are displayed, press on to start the game.

Each level has a password which is entered correctly - avoids entering back on level one to play the controls are precise and responsive. The 3D rendering is detailed enough and convincing - even on a standard ST. Objects including weapons, keys and medals, are collected by simply walking over them and selected for use by pressing the appropriate key.

These control essential gun. To become fully to use could you in all top of them. approach isn't an edge to take them out.

Like Substitution, the colours are muddy and muted but with only 3D colours to play with that's a no surprise. Unlike Substitution the creatures become more detailed in their approach - look it out for giant beetles, rock monsters, robots, mutants, giant bats and giant like robot.

These supply lines are great this will be designed to inspire you in later levels.

The game has very animated maps. The only video in the gameplay when active.

Just being all on their own (I was only clearing it - honest gun) and with no background music the samples sound a bit tired. There are some nice touches, my favourite is watching the weapon power to reload with ammo from time to time.

Definitely a game to get new users try, although I got to level five in order to hear before a bunch of mutants persuaded me to get on with this review period.

Destruction imminent, in contrast to Substitution, runs on a standard ST to like to see the audio and mapping screens active most of the time. Some level up samples, more aggressive creatures and slower graphics but as a reward it's one Doom clone you can let your kids have on without fear of going there, right now and.

nemesis

SYSTEM ACCELERATOR

The stunning new Black Scorpion development which offers true 24MHz performance, making the **ENTIRE SYSTEM** running 150% faster. Coupled with 486MHz DSP and TPU speeds, Nemesis just can't be beaten!

Apart from pure acceleration, Nemesis can cure many of the problems that are found on even standard Falcons. If you've ever had nasty audio and/or unreliable SCSI, then Nemesis provides the answer. It includes 300Hz audio playback and 100% glitch-free DMA.

Adding Afterburner to a Nemesised system just places the Falcon into Warp drive - a performance increase in excess of 9x of a standard Falcon.

Nemesis also gives incredible high software and hardware compatibility with the further advantage from the 24MHz bus that can provide 640x480 16-bit true-colour Desktops.

Nemesis @ 34MHz/480 16-bit true-colour, unaccelerated resolution on 14" VGA monitor (approx)

Vidality Video	800 (P40)	670 (P44)	Native (P4)

VIDELITY

SCREEN EXPANDER

Although capable to run with a standard Falcon, Videlity can be considered as a "must have" option for Nemesis.

Vidality is a perfect complement for Nemesis, and can be used to configure the highest resolutions possible for the Falcon. Videlity also includes built-in external hardware support.

Used with Nemesis extends the video performance to a massive 736x560 true-colour or 1024x768 (17" 16" or 23" colour) resolutions or standard 14" VGA monitors.

Vidality Feature List

- ◆ 4:3 aspect ratio enable
- ◆ Load/Save configurations
- ◆ Monitor Protection support
- ◆ Full support for Nemesis
- ◆ Other accelerator support
- ◆ Frequency Lock enable
- ◆ External video hardware support
- ◆ RGB & VGA support

Simon Coward meets his

demons

Left: off is an extensionary power (battery power was absent)

After the fiasco came the hand to fix the plate for the board looked fine, and my first thought was 'is that?' followed by 'how much?' I was shocked when David mentioned a year lag of work. But the vision has again been thus planned 'because for this lag'.

Looking upon to systems more speed out of the board and its a variety of more Paltron hardware bugs at the same time.

Fitting Hardware

Hardware is available for DFI extensions but I lack my Paltron to this. Design and was had Dave Murphy install the board. Dave has fitted a number of boards already and is getting faster all the time but it quickly became clear you have to follow the manual. In the future?

After searching the installation I believe I could have done it. I'm disappointed with a working tool, but no extensions exist.

Some of the tracks which require routing are less than four inch, and then they have to be soldered in. I'd recommend

preparing me and extend board before trying the real thing and follow the standard testing procedure described in the manual. I've tentatively tested the machine throughout the procedure which is likely to miss around two undisturbed hours of concentration. I was not confident about your ability to use the living service offered by Tizen or The Upgrade Shop.

The manual

Judging from the first manual it is much more than a set of instructions with loads of technical facts and tips. Tizen have been through experience along with photos and diagrams which take you through the installation step by step.

Full clean build

Once installed Hardware was three patch programs which run from the Auto Update. These enable Hardware to run and enter between the two clock speeds provided.

As soon as the Hardware was back together I couldn't wait to test it, and as you can see from the results (see below), I was not disappointed.

We can find the Thomson 1600 board, which I've played on a Platform, but with Hardware controlling the DSP CPU and the Bus running in the Thomson 1600, which machine I'd rather play on. I look forward to this project being completed.

Extended video

Thomson 1600s coordinates the entire system, not just the CPU. It is possible to extend the video mode. Using my VGA monitor TrueColor running at 640x480 resolution is not steady, and not enough for me to write this article in. Program could also be a turning point for Paltron software. I've just loaded a TrueColor image into Program while using TrueColor. DVI mark into a Paltron even without a graphics card is possible today - in my I am impressed would be an extension more. I can't wait to get my hands on the forthcoming Thomson 1600. Having software in progress even more with out of my window?

In 1993 the Paltron board was 1993 the Paltron is showing its age. The lack of software demands higher standards, it will be hard working with Paltron or CMI in 2000. I hope you know what I mean, the Paltron needs a full upgrade but the need for speed usually means expansion.

Last April David Boff of Tizen Design distributed the Back Boop an software (ROM) probably showed me the early design for Hardware, an extension which handles the central processing unit (CPU) operates the DSP CPU (I think) and manages the bus speed at the same time. This resulted in an overall increase in performance and enables the TrueColor at 640x480 resolution. I'd built the board to complement its age, software range, the

It is Hardware with Magic and Magic in mind you are having a power user's system?

The following real-time tests were performed after startup was finished before results test.

- **Black Box:** Complete a 1000 program, no RAM
- **Expanded spreadsheet:** Load and display a 1000 spreadsheet (less or more data)
- **TrueImage art package:** Load and display a 1000 DVI image
- **Simulation:** Display a 40 level 600 file
- **Programs:** Complete a program, no RAM

Through 10 pages of text

- **CAD:** While between Load and display the 1000 Alpha page from Alpha 1000 4
- **AFPS:** AFPS (more) Load and display a 1000 image

Four different system configurations were tested:

1. Bare system
2. Magic 1/1000 3
3. The 1000s
4. Magic/1000/1000s

The test system results at 1000s and 1000s

Q The hole for getting soldering iron flow wasn't small and got smaller as you cut out. After about 10 minutes, the solder was out. I was able to remove the solder from the hole. I was able to remove the solder from the hole. I was able to remove the solder from the hole.

Compatibility

It is all very well going faster, is higher resolution and color display than ever before, but what about compatibility?

True, IBM does offer a lot of time sharing, but compatibility with a wide range of software and all of my software is happy with the IBM/PC. I've never had to resort to the lower speed. The only thing I have recognized is a momentary screen flicker as the screen dies out, but the system remains perfectly usable, so it is only a very slight.

Part of the problem involved my board and I got the data that supported my system in the next board. It was a very fast. The software IBM have designed for the IBM/PC software seems to have paid all hardware.

Benefits of work

While Compaq's system is a useful reference, the IBM/PC seems to be a useful reference. It is a useful reference. It is a useful reference. It is a useful reference.

All you can see from the real-life tests. IBM/PC software seems to be a useful reference. It is a useful reference. It is a useful reference. It is a useful reference.

WWW We have lift off!

If our online website does then you control menu, and we're playing with lots of different designs.

You'd be hard pressed to see a paper magazine for any computer platform these days that doesn't also have an online presence, thanks to the World Wide Web. Here at Atari Computing, we're no exception either. We've been browsing away for quite a while now to bring you the best Website we possibly can, and now we can let you behind the scenes to see what's happening.

Where's it been?

Let's take it down to earth. We originally talked about the Atari Computing website last year, when plans for the magazine itself were still in their infancy. So why have you had to wait until now to see something up and running? The main reason is, well... (the A) CD team have all been hard at work producing the first magazine you can believe you now, and there simply isn't enough hours in the day to come up with a website as well. I've been lost in the wilderness (but in PC and Mac world, so I haven't had time either. Finally we've managed to bring the piece out of what little time we have left to establish an Atari Computing presence on the World Wide Web.

What can we expect?

One thing you won't see is the online magazine on the web - we're not about to take the online map and slap it on a webserver. It wouldn't be practical or cost-effective, and we probably wouldn't tell any of the real thing! What we will be doing is producing an online companion to the magazine. We'll be taking the best from each issue, and providing you with news, jokes and features of what you can expect to see in the printed version. If

We've finally made it onto the World Wide Web!
Our new Online Editor Frank Charlton is here to tell you what you can expect to see when you fire up your web browser...

you're outside of the UK that means you can drop in to see what's happening on the

internal before it lands on your doorstep.

The full-colour nature of the web means we can also let you see some of the illustrations in the magazine as they were originally drawn - if we review a new graphics package for example, you can get online and see just how it really looks in-screen. We'll also be able to provide direct links to the sites provided by many Atari companies, so you can jump directly to their web pages and read more about their products.

straight from disk. Let us know if you're interested. And see it soon.

Where is it?

Point your browser at this URL: <http://www.atari.com.au/magazine.html>. Make sure you add the address to your bookmarks, so you can drop in regularly. There will be a major update with every new issue of Atari Computing, to reflect the current magazine, and we'll also strive to update whenever we can - even between issues.

Is that it?

Oh, the forthcoming CD-ROM and WebSpace supports issues, so we may add them to our site later on.

We intend to present an occasional web-exclusive. We certainly don't want to distract from the magazine itself - the website is a companion, remember - but we may just sneak the odd article in there which hasn't seen the light of day. Please don't fret! And if you're not online, though, the classic rule will always appear in the magazine first.

What do I need?

Simply an Internet connection and a web browser - the HTTP/1.0 combination is ideal. In consonance with other user groups, we might be persuaded to produce an offline version of the pages, ready to read

Not at all. Like any web publication we'll be relying on your feedback. Tell us what you want to see on the website, and what you don't want to see. Don't be afraid to complain if you think something doesn't look right, or if you want to see more of a particular thing. We'll read every piece of feedback we get and strive to give you the best online edition to Atari Computing we possibly can. You can write to us via the office, or for a faster response (to website-related enquiries only) drop an email to web@atari.com.au.

Whichever method you choose, please do let us know what you think. ☺

ATARI

function. There is a special **C** drive which allows access to real partitions and floppies. **new**

Currently there is no convenient way to set up the drive to allow boot time selection between TOS or Magic. It can be achieved easily enough by installing Magic PC twice and selecting between them but one solution which requires it to be added the ability to select between different boot data. It needs the same way boot managers work.

Real Magic

Once the desktop appears the only operational differences compared to other Magic versions are the special key combinations used to switch between Windows and Magic (the alternative: Help/Info keys) and keys to access the Program Manager. Special character are supported using the **[Alt+Insert] + ASCII code** method on the number pad method.

Compatibility

Magic PC is reasonably compatible. Any software which runs under Magic on a real Atari machine will run on the following computers (should work fine):

- Most games (up to about 1.5MB)
- Software which requires a text or spreadsheet (TPU)
- Software which requires the Falcon's DMP
- Software which requires a display
- Software which accesses the MIDI or cartridge ports

The ability to boot TOS is an important feature over Magic Mac (V4.2.0)

Auto Loader

Magic transfers the execution of Auto Loader programs differently to TOS, which executes programs in the order they are loaded into the Auto Loader. Under Magic PC the Auto Loader includes a batch file called **ALTCORROR.BAT** executing a list of programs in running order, a simple and practical solution. This file can be edited at desired using any suitable ASCII text editor (I used **Vi**).

Games

Games work well, with support for all linear CDROM ports and speeds between 3600 and 30000 bps. Although you'll need a fast Processor to get reliable data transfer at higher speeds. The auto loader Processor was set to 30000 and tested as follows:

- Confirmed: Manual input to 30000 file download and browsing
- Simple: LUTROS Point escape automated action-repacing ticks and file transfers. Simple doesn't work properly under Magic Mac (V4.2.0)
- Advanced: Casual automated response (delta) and manual auto-loading. I did experience a problem with G2000 V3 which kept starting transfers and ending with protocol errors but these went away after a TOS and some updates involving the G2000 switches. Turning off L and S worked for me. The serial port can be deactivated if not required.

Floppy failures

Floppy handling under Magic PC is a lot better than Magic Mac (V4.2.0). Data is

NVDI PC

To break the 16 colour barrier NVDI PC is required. This supports all colour depths from 16 to 24 bit all the way up to 32-bit (if 1 million colours) and methods of all colour display support.

Magic PC, version 1.10 (V1.10) is a boot time only installed on and on to a single drive. It's a picture of the Windows settings. For example, with Windows in 32 colour mode Magic PC can be loaded into TrueColor. This is achieved by following the screen output.

Although NVDI PC is an optional extra it dramatically improves colour speed and gets better with each new release because the original Windows mode is implemented being shipped out and replaced with native Intel mode. Add to this the greater drive support (including colour printers) and NVDI PC starts to look indispensable. The choice is yours.

It isn't NVDI PC (Right) Magic PC only in addition to adding support for more than 16 colour resolutions NVDI PC offers enhanced performance across the board.

re-themed largely with a 32-bit window to use the Win95 floppy to a single sided 3.5 version. It breaks also works of changing resolution, and resolution from Windows. However, you can't move into 32-bit images and read them back if it's using Drive capabilities. Providing a method to launch bootstrapping or disk based software.

However, if you're thinking of switching to Magic PC and using your real Atari machine you could run into difficulties. Most PCs use internal IDE drives with SCSI support as an optional extra. This means it's convenient to have large amounts of data between machines. For example, you can't plug a SCSI CD or hard disk in the back and move stuff across. At some point you'll need to install software from floppy and install of the current programs listed related to computer and I had to write an alternative but to have your working range from any Falcon and especially those under Magic PC.

Printing

Default has applications which require GDIOS (such as Keyboard and Call) requires NVDI PC and is available free and fast. It might be possible to get output using other GDIOS programs but NVDI PC is made for the job and basic line.

However, printing from the desktop or from programs such as Calamus. That's a feature as Progress using things like were tested and all worked fine without NVDI PC.

Magic PC was not even. I was surprised my 640 supported. But was the fastest resolution I'd ever seen on the Atari platform. For the real speed Processor PC was around 1000 (approx) Unless Magic PC v2 improves data handling and colors the ability to boot into TOS will probably reach platform Q.

Persistent vision

Thomas Mains explores the Persistence of Vision Raytracer...

The Persistence of Vision Raytracer (POV-Ray) is a relatively new software package which transforms any Atari computer into a powerful graphics tool. POV-Ray allows you to create stunning and realistic three-dimensional images. Even if you don't possess traditional artistic drawing skills, with POV-Ray you will be able to create beautiful Truescopic images with perfect shading and perspective.

Raytracing is not limited simply to light and shadow. Colour, intensity, texture, and reflection also play an important part. Let's bring our example down to earth. Images of a tennis ball on a table and illuminated it with a desk lamp placed directly overhead. Viewing the tennis ball from table level, neither the top of

Even if you don't possess traditional artistic drawing skills, with POV-Ray you will be able to create beautiful Truescopic images with perfect shading and perspective.

System requirements

The POV-Ray system

runs on all Atari computers, but because of the texture of its output 386/486 Truescopic images

it really requires a Falcon or ST/TT equipped with a graphics card. POV-Ray's

renderings are

multibyte-rendered so fitting a

maths-coprocessor (FPU) significantly

increases the speed images can be

rendered and is recommended

What is Raytracing?

Raytracing is a way of rendering

pictures in three-dimensional space by

describing objects which exist in that

space and the light sources shining on

them. For example, when we look out

into the night sky and see a crescent

moon, we see an object (the disc of a

sphere) which is only partially

illuminated by the light source (the sun). If we were to trace the rays of light emanating from the sun, we would see some of them strike our object, forming the visible crescent and others blocked by another object (the earth) which would form the shadow on the moon. The procedure of tracing rays of light to determine which objects are illuminated and which are not forms the basis of raytracing.

Raytracing is a way of rendering pictures in three-dimensional space by describing objects which exist in that space and the light sources shining on them. If we were to trace the rays of light emanating from the sun, we would see some of them strike our object, forming the visible crescent and others blocked by another object (the earth) which would form the shadow on the moon. The procedure of tracing rays of light to determine which objects are illuminated and which are not forms the basis of raytracing.

Raytracing is a way of rendering pictures in three-dimensional space by describing objects which exist in that space and the light sources shining on them. For example, when we look out into the night sky and see a crescent moon, we see an object (the disc of a sphere) which is only partially illuminated by the light source (the sun). If we were to trace the rays of light emanating from the sun, we would see some of them strike our object, forming the visible crescent and others blocked by another object (the earth) which would form the shadow on the moon. The procedure of tracing rays of light to determine which objects are illuminated and which are not forms the basis of raytracing.

have a spot reflecting the light source. This was unavoidable on the tennis ball because its texture allowed for the spot's absorption. The spot of light on the marble that reflects its light source adds a greater degree of realism to our scene. We perceive the texture of objects without touching them using this kind of visual information all the time without realising it.

A raytracer uses texture information to calculate the way light should reflect from objects. A selection of textures are provided in the POV-Raytracer, allowing realistic three-dimensional scenes to be easily created. Finally we need to consider reflectivity. We have explained how rays of light reflected from textured objects influence our perception now we have to consider how direct reflections from other surfaces are added to give objects realism.

Replacing the marble in our example with a poolball we can be fooled not only as a sphere with shading reflecting a light source, but we can also see the reflection of other surfaces upon its face. For example, we may see a representation of all the other objects in the room wrapped around its shape. The poolball acts as a mirror of the space surrounding it. Of course, because a poolball is spherical the image is distorted. A raytracer

GETTING POV-RAY

The POV-Ray source is free and available from all good PC/Amigaware stores and on-line services. Dirk Kohnert in Germany has compiled version 2.0 of the program for Atari computers and is working on a graphical shell interface to make using the program even easier to use. If you have internet access, be sure to check out his page at <http://www.mhnet.de/~mhnet/dk-1.htm>

mathematically calculates the amount of distortion of reflected objects appearing on the face of a sphere with a mirror finish and "wraps" or "wraps" the distorted picture onto the sphere to achieve the illusion of three-dimensional realism on a two-dimensional computer screen.

POV software

The Persistence of Vision Raytracer is a unique program in the graphics field. It's actually not doing 3-D or traditional painting and illustration programs. The POV-Ray program creates images from text input instead of drawing using a mouse or graphics tablet; you describe the scene using a simple scene description language. POV-Ray uses this information on a screen description file to render the final image.

It's only words

On well-established literary assets, the two hemispheres in our brain support different types of thinking. The right brain supports intuitive, creative and artistic reasoning whereas, the left brain is oriented more towards analytical and rational reasoning. Since POV-Ray uses mathematics and a computer programming language to render the scenes, it's logical to conclude

POV FROM THE DEVELOPERS OF POV

The Persistence of Vision Raytracer was developed by a dedicated team of computer programmers and graphic artists who meet on-line regularly to discuss raytracing. Most users have come from the almost every computer platform including the IBM-PC and compatibles, Apple Macintosh, Commodore Amiga, Unix workstations, and of course the Atari platform. The Atari version produces identical output to all the other computer versions and all versions share the same standard include files. The ability to switch platforms and continue working is of major importance to users of many platforms. As a result of this cross platform approach, the POV-Ray format has become a standard in the graphics field and a vital application in my arsenal of quality software on the Atari platform.

POV-Ray is a left brain activity indeed. It does have a logical and straightforward structure which often intimidates creative people. I use POV-Ray as a marriage requiring left brain activity during implementation and right brain activity during the design phase and I believe the results are both or as a result. POV-Ray's Scene Description Language (SDL) data seems daunting to anyone brought up using a linear list. I assure you the time spent learning a few elements is rewarded many times over when you see the quality of the scenes you can render with this amazing application. Mastering the POV-Ray SDL does take time but within half an hour anyone can render impressive looking images. Let's look at an example.

Figure 1 shows a complete POV-Ray file to render a sphere on your computer screen. The first three lines tell the raytracer to use some pre-defined colours, shapes, and textures in this scene. Using these include files, scene and the trouble of defining these objects ourselves. The second part of the file specifies where the camera should be located, in other words from what perspective shall the scene be viewed. Notice the location of the camera, sphere and light source are all given using three numbers. These numbers represent the object's location in three-dimensional space on the x, y, and z axis. I bet you're wishing you'd

paid attention during your math lessons now aren't you? The third part of the file specifies the object to be placed in the scene is a yellow sphere. Finally the location of a light source is given to illuminate the object.

What's in the package?

POV-Ray comes complete with development instructions, comprehensive reference documentation and some pre-defined textures and sample scenes ready to render. There are far too many to list here, but to give you a flavor here's a selection of pre-defined textures you'll be able to use:

- Classic white marble with red veins
- Jade
- Grey blue again pink granite
- Dark blue sky with clouds
- Clear glass
- Wood
- Lustrous mirror and glass textures
- Heavy gold lacquer, copper and silver textures

Figure 2 uses the glass texture on a sphere with a pre-defined background consisting of the Atari logo.

An array of basic shapes is also included with the POV-Ray distribution including spheres, cones, boxes and a multitude of geometric and organic shapes. POV-Ray can include bitmap graphics into scenes and bitmap images can be wrapped around boxes, cones and any other object in your raytraced picture. The file image is an Atari logo I created using a paint program then mapped onto a sphere using the POV-Ray package.

And there's more...

There wasn't room here to include every POV-Ray tool but I can't resist showing you sports by animating animation. Creating raytraced animation is a relatively simple because once you have created a scene, it's simply a matter of rendering additional frames to create animation - you could simply store the camera position or do much more. The only limit is your imagination. ☺

FIGURE 1

$$\lim_{n \rightarrow \infty} \frac{1}{n} \log \frac{1}{n} \sum_{i=1}^n \frac{1}{i} = \lim_{n \rightarrow \infty} \frac{1}{n} \log \frac{1}{n} \sum_{i=1}^n \frac{1}{i} = 0$$

USR Sportster Voice 33.6 Faxmodem

Plug 'n' play with All Good!

Their phone: Plug is plug and introduced as a Top Gear feature in Windows 95 but as the case of the new external hard drive from US Robotics and now Seagate is quite subtle.

I bought my first IBM Spectrator model 3140 model a couple of years ago and it still is everything as it is. I bought a captured the 14 000 model with a Spectator 3110 (300) which stopped working last September so I took it back to PC World who told me it had been replaced by the IBM Spectator Point 3140 Formfactor and very little hardware. I was soon finding fault with a new Spectator model and first year warranty as the additional card in use and in use of the system. For some supported paying a small premium but it was not worth it.

As for final pluses the line is identical to the 20 000 model but has chosen transportation a small red flash produces 50 000 capability and a small manual add/drop describes the new formula. It is a full standard of the manual with only a few colors 20 000. Another reason is that the only full speed connections I have had are with the 20 000 standard version.

The modem is GAT approved and additionally supports V.42 (8Kbps), V.42bis (4Kbps) and Class 1 and 2 fax machines up to 14,400 baud.

The package includes a 3-pin serial cable, 75 Mega Bits and Fastnet network card (plug & play) straight in along with a 3 to 25 pin adapter for use with BT models, standard BT RJ45 phone cable (100 foot), power adapter and PC software for instant use, which would amount to the list.

Finally 1991 has a rounded top, retains the original Monopower look of the predecessors, is famous for sharp grey, it feels solid and looks great! The inside is roughly 3000000 mm and cut in flat or upright, along the integrated stand. The stand itself is located to the left side for top of head upright; where it can be easily reached and a small volume control leaves the rest of the keyboard a constant of perfectly correct settings.

As the model, this suggests more teaching and playwork is suggested but, as noted above, will be a debate.

HOT TIP

Let the RJ45 cable supply with the modern 10/100 and enables log-on anywhere until 1000 is - you have, have you?

[illegible]

Registering an existing machine enables the company to plug the machine in to its twelve year contract, allowing it to take advantage of the higher throughput: 150,000 tpe works fine on any machine but the total plot on standard ST machines is limited to 10,000 tpe although ST and commercial serial plot controllers are available.

It goes on selling up a modern bid like
 good ones there are a few great old
 inside (the house)

100

TESS have been used (see Support) with little technical support for trials probably due to a lack of funding for this research. For more information, see www.tess-uk.com.

1000

Although the price I pay is small payment for this teaching edge, modern LRM are an establishment of a company to an ever changing marketplace, which means they'll just continue to increase the time you spend to do most other business matters. ☐

3.3.6 MODEM

1000

Only use these tags to work with the bundled RUI IC cards. ST's require a special port modification for the device (see 1.4.20.1 here).

9134

Extended play

Xav begins a new mini-series looking at enhanced joystick ports. If you haven't got an STe, Falcon or Jaguar you may like to turn the page now...

If you've made it past the intro under the impression your things will happen, sorry, this mini-series concerns hardware you haven't got: the enhanced joystick port (ESP).

OK, now we're done, take a look at the pair of ESPs on the right-hand side of your machine, just below the keyboard - unless you own a Jaguar, in which case they are the joystick ports on the front. See them? Little things where you might occasionally plug a joystick into, or use to power your ScreenSaver or TimeUp. Don't. Now you know what I'm talking about, I'll explain why I'm talking about them.

You might find it odd we think these miscellaneous ports justify a series of articles? Well, these ports have never been fully explored and you may be surprised to discover what you can potentially plug into a them.

- Joystick
- Analog joystick
- Mouse
- Digital joystick
- Rotary controllers
- Light pens/guns
- Temperature sensors
- Lots more!

I can't promise to cover all these in depth but the series is going to revolve around an ongoing series of various experiments and circuit ideas, some of which might never be covered into working. Hopefully the more adventurous amongst you will try some experiments and between us we can get the ball rolling.

What I can promise you is a selection of explanations, circuit diagrams and sample code which should provide a foothold from which we can all explore the potential of the ESP, whether you're a programmer, an electronics enthusiast, or a games

player. Not everyone will find all the projects of interest, some will be aimed at Jaguar owners others at computer owners. This isn't to say the projects can't be used by both groups, but rather the necessary software support isn't present in the current

selection of games and applications is an attempt to help remedy this situation, however, if I intend to include single code whenever possible as the programmers amongst you can actually use the hardware I'll be describing.

Teasing up

If you're going to join me over the next few issues and build at least a few of the ideas I'll be covering you'll

- Wire cutters and pliers
- Needle-nosed pliers
- A steady work table

All though not essential, a multimeter or continuity tester will be very useful for checking your connections. A battery and bulb will do the trick, but if you can get your hands on a multimeter you'll find life a lot easier. Any components, unless otherwise stated, will all be available from Maplin electronics, whose catalogue is available at larger supermarkets. Where appropriate, I'll list Maplin order codes for any parts or hardware other than components. I won't be saying much about bases and mechanisms though, as the exact requirements here will depend on your own circumstances. Soldering skills and safety will probably be required to

well. If you want to delve into the more exotic aspects of the ESP, you'll also need a C compiler and a basic understanding of the language. If all you want to do is build some hardware to use with other people's programs, this won't be necessary.

Gearing up...

If this seems like a long list of tools to gather up, don't worry, these don't panic - you've got plenty of time because I'll be visiting a devoted eye over the inner workings of the joystick first of all. Finally, as I've mentioned already, this series is intended to inspire the more talented hardware hackers amongst you to get a hands-on feel for the capabilities of the ESPs. Because of this, I'd like to know about your successes and failures, as well as your opinions on the content and level of the series, so if you're online feel free to post me at tw@compuserve.com or to

actively contribute send a selection of e-copies too. To save me repeating this list, every group has got it out of the way now.

- A soldering iron
- Solder (preferably 60/40)
- Screen-stretched look-up wire

HTML intro

CAD is fast becoming one of the most talked about packages on the Mac platform. Not only is it being used in conjunction with STAR and MINTNet to browse the World Wide Web, online it is becoming a popular publishing medium for disk magazines with both Macintosh and XT Applications published as HTML documents. HTML stands for HyperText Markup Language¹ and it is a method of describing how pages of text and images should be formatted and linked together. That's the Mac-speak. HTML also provides a way of linking pages together - that's the Hypertext bit.

HTML was reserved as a standard language capable of being displayed irrespective of the hardware/software used - so a document created using CAD on an Mac would look the same when viewed in Netscape or Explorer on a Mac or PC etc. Things rarely turn out as planned, and thanks to individual companies adding

Nell Jones-Rodway introduces a regular new series getting to grips with HTML coding...

Ingredients

What do you need to get started? Surprisingly not much, and you probably have most of the software already.

You'll need a plain vanilla text editor. Emacs, Edit, QED or similar will do fine. An HTML browser to view your work - Call is currently the best choice. You'll need to create some images, preferably if you consider you

will need to make development easier but it is not essential.

Where to start

You need something to write about. Contrary to popular belief, the most difficult aspect to creating a good set of Web pages is deciding on the content. Compared to that, the actual HTML coding is easy! Before writing the pages establish as clearly as possible WHAT you want in your pages and HOW you are going to organize it. Remember, linking pages together is one of HTML's founding principles, so make good use of it.

The decisions are down to you, but just to illustrate a few examples I've reserved some links into the text editor used in an HTML file and loaded it into CAD.

Because HTML is designed to be displayed in windows that can change size, you can't use the formatting that is supported by an old systems text editor. The browser will completely ignore carriage returns, and formats the text to fit the window - unless you tell it otherwise.

Tags

Tags are wonderful. They tell the text and tell the browser to do all sorts of wacky things. One of the most basic tags is the `<p>` tag. Putting this in the text tells the browser you'd like to start a new paragraph so that

Contrary to popular belief, the most difficult aspect to creating a good set of Web pages is deciding on the content. Compared to that, the actual HTML coding is easy!

can track your man. A mindboggling opening credit card is Magic.

QUICK REFERENCE TO TAGS USED

1. Title

2. Header

3. Paragraph

4. Bold

5. Italic

6. Underline

7. Horizontal rule

8. Image SRC is the image's filename

9. ALT is the substitute text

10. Specifies a link

11. Specifies a document within a page

Declares a title for the page

Specifies a header (1 large, 6 smaller)

Starts a new paragraph

Formats a line break

Bold

Italic

Horizontal rule

Image SRC is the image's filename

ALT is the substitute text

Specifies a link

Specifies a document within a page

If you use a text editor that supports 'kernels' (Emacs or Edit) use these. Not only do they save your fingers loads of tedious typing, they also ensure your documents are in the correct HTML syntax.

The HTML 3.2 kernel, compiled by Marko Koskarinen (marko@ccs.helsinki.fi), offers a comprehensive set of all the tags supported in CAD (including the forthcoming CAD v2.0) along with many proprietary 'Xtags' not known to the official HTML 3.2 specification.

Displaying files

Some files can be displayed on the screen when you double-click on them, others can't. Why not? Mark Barnes explains...

Some files can be displayed on the screen when you double-click on them, others can't. Why not? Mark Raines explains...

And you will have found that TOC allows line containing text to be displayed on the Desktop by double-clicking on them. So? Well, try it by double-clicking on your DESKTOP.INP or WINDOW.INP file. A short hint is shown with the Show/Print/Cancel buttons. Click on Show and the text is displayed. The

1000

Most of you will have tried to double-click on either non-convertible files or on text languages or to try to display them on the screen. Such files are those without the PNG, TIF, GIF, APP and CTF filename extensions (note that not all versions of TIF and alternative desktops support the CTF extension). One of two things normally happens which depends on the file format. Either the file will be displayed clearly showing text characters you can read and make sense of (as about with DESKTOP.INI) or the screen fills up with a whole mess of characters and lines appear with no meaning, sometimes sections of text and the computer 'plugs' at you constantly. Sometimes in this situation, the screen display can become confused and the computer may even crash. Try this with an unnecessary file with the .SGF or .ACR filename extension. Characters are stored as bytes. Each byte consists of eight bits and there are a total of 256 different

205 The characters that we normally use the best are those in the ASCII (American Standard Code for Information Interchange) character set numbered from 32 to 126 inclusive. That includes the upper and lower alphabetic numbers and punctuation characters. Only some of the first 32 characters are available on Telex.

displayed and only under certain circumstances because not all programs allow their use. IBM programs use some of them as special symbols. Look at the figure—recognize any? Other programs use them, though, so

control codes. Character zero is the NUL (null) character and represents the Character seven is the BEL (bell) character which causes the computer to "ping" when sent to the screen. There are carriage returns, tab line feed, form feed and backspace characters and character 127 is the DEL (delete) character. All the characters from 128 to 255 contain the European accented characters. Hebrew, Greek and math symbols that, upon only some programs can access such as word processors and editors. These characters are not part of the ASCII character set and are not standard. Only some PCs have the

• The total character set (comprising any of the characters below) is 256. Many of the letters are identical on PCs especially the accepted ones and those above 255.

[illegible]

Abstract

1. The first step is to identify the problem. In this case, the problem is that the system is not working properly.

Historic character set based on the EBCDIC standard set of 8-bit and less drawing characters for language. Chinese calligraphers may be more familiar with these and most dot matrix printers can be made to use them when switched to IBM mode.

---	---	---	---	---	---	---	---	---	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	-----

Text files come in two basic formats - plain, straight ASCII text format or ASCII Streamed ASCII files contain nothing but text characters from the ASCII character set, generally only within the range 32 to 126 and virtually exclude a carriage return character at the end of each line. Word processor files that have been saved in ASCII format, and those from text editors are usually pure ASCII. Some other programs store their data as pure ASCII text files, such as the **DESCRIPTOR** INF or **ADDRESS** INF files. There may have likewise been others, such as **GAT**, **INF**, **SIS**, **ENF**, **LST**, **W**, and **LST**, but this doesn't mean that these types of files are always straight ASCII, though it is normally intended for the user to view these files from the Desktop or for the more advanced user to directly add them to an editor. Our files section has useful information.

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	36	37	38	39	40	41	42	43	44	45	46	47	48	49	50	51	52	53	54	55	56	57	58	59	60	61	62	63	64	65	66	67	68	69	70	71	72	73	74	75	76	77	78	79	80	81	82	83	84	85	86	87	88	89	90	91	92	93	94	95	96	97	98	99	100	101	102	103	104	105	106	107	108	109	110	111	112	113	114	115	116	117	118	119	120	121	122	123	124	125	126	127	128	129	130	131	132	133	134	135	136	137	138	139	140	141	142	143	144	145	146	147	148	149	150	151	152	153	154	155	156	157	158	159	160	161	162	163	164	165	166	167	168	169	170	171	172	173	174	175	176	177	178	179	180	181	182	183	184	185	186	187	188	189	190	191	192	193	194	195	196	197	198	199	200	201	202	203	204	205	206	207	208	209	210	211	212	213	214	215	216	217	218	219	220	221	222	223	224	225	226	227	228	229	230	231	232	233	234	235	236	237	238	239	240	241	242	243	244	245	246	247	248	249	250	251	252	253	254	255	256	257	258	259	260	261	262	263	264	265	266	267	268	269	270	271	272	273	274	275	276	277	278	279	280	281	282	283	284	285	286	287	288	289	290	291	292	293	294	295	296	297	298	299	300	301	302	303	304	305	306	307	308	309	310	311	312	313	314	315	316	317	318	319	320	321	322	323	324	325	326	327	328	329	330	331	332	333	334	335	336	337	338	339	340	341	342	343	344	345	346	347	348	349	350	351	352	353	354	355	356	357	358	359	360	361	362	363	364	365	366	367	368	369	370	371	372	373	374	375	376	377	378	379	380	381	382	383	384	385	386	387	388	389	390	391	392	393	394	395	396	397	398	399	400	401	402	403	404	405	406	407	408	409	410	411	412	413	414	415	416	417	418	419	420	421	422	423	424	425	426	427	428	429	430	431	432	433	434	435	436	437	438	439	440	441	442	443	444	445	446	447	448	449	450	451	452	453	454	455	456	457	458	459	460	461	462	463	464	465	466	467	468	469	470	471	472	473	474	475	476	477	478	479	480	481	482	483	484	485	486	487	488	489	490	491	492	493	494	495	496	497	498	499	500	501	502	503	504	505	506	507	508	509	510	511	512	513	514	515	516	517	518	519	520	521	522	523	52

• An advisory displayed on screen using the message "User Not enough space on disk!"

AREAS FOR initial settings.

Mail loading

KMail is controlled by two essential MAPI files in the main point folder. Refer to the KMail help and KMail.CFG files located in details.

KMail only requires that the first line initially had with eventually include details of all the message areas you connect to automatically added by using a simple keyword in KMail.CFG. The first line defines your Origin, which can consist of up to 16 characters of your choice. The second line defines the Mailbox area and the next three relate to important system files. Enter any path and follow with KMail.CFG begins with three sets of recommended parameters, each grouped

SOFTWARE STATUS

- KMail is Public Domain, currently developed by Darren Hook
- KTTY is Freeware by Daniel Kuehn
- Smaper is Shareware by Joe Krizan. IET registration permits about two or two way file transfers and the recipient capability
- LEO is Shareware by Stephen McLeod. IET registration removes nag screens and allows reading and writing of UTF8 encoded files
- IET Registration for Smaper and LEO is through Kevin Osborn, Symp of the Fortran 95S 80 1820 Email, Inc

under a label. The labels used are the ones entered into the CMD line when compiling the KMail.exe. Smaper and Smaper will match exactly. Using labels allows the command line only user needs to be changed in one place. Most KMail users will include your name, your address and password, protected links to the WWW for each network. Coming to the KMail documentation list addresses need to be used as shown in the examples. For ease in changing between your point addresses in the Address list and the LEO addresses in the Forward list when you calculate the password speed with the display for each network entered in the Smaper list.

Users either Smaper or LEO can be used for parking and parameters for each should be specified as shown. Most users the typical and download paths are not to match those specified for inbound and outbound to Smaper. Smaper commands need to be set up for each separate network. In the latest release to ensure your mail reaches the correct destination, the Application paths should be directed to the reply address created by Smaper for each linked network. Only the Host address is directed to the default Outbound folder. Further routing commands are used to combine messages for several networks into a single mailbox file upload. The first address to KMail must be the default Host address of the WWW with all other addresses following. With no many parameters needed a toggle is used to trace any errors encountered by KMail. The settings shown produce a mailbox upload directed into the LEO folder created earlier. Other required keywords are placed at the end of the file.

Message editor
LEO is a message editor which offers many powerful options. But initially a basic configuration file is enough to get you up and running.

With this complete you're ready to connect, and get some message areas.

Joining up

Run Smaper and press it to open the LEO message reader. In the Area select option, Open, and you're presented with the 4 areas you set up in KMail.CFG. Select Mail. Your first task is to ask the WWW what areas are available. To do this select Edit May from the Edit menu and send messages to attach the each of the WWW network addresses. The subject line for each must be in the form: #PASSWORD: and the body of the message should contain blank.

Joining KMail messages areas off-line

Save each message and exit LEO back to Smaper, select E and KMail will export the messages and create a reply folder. Now press the function key up, up to dial the WWW. Smaper will upload the packet using a built in the transfer protocol. Now as before for the WWW to do work then dial to again to collect the replies. On receipt, Smaper will KMail which imports the replies into LEO's Mail area. Using the status of the areas available on each network, send another message to enable for each network in the same way as before. Up now list the areas again, one on each line, in the body of the message. As before save, exit LEO export messages to KMail and call the WWW again to upload the messages. Call the WWW the following day and the messages posted to each area will be in the mailbox in the Personal folder.

User Group NEWS

Belgian User Group

The Atari 486 users group held meetings bi-monthly: more active and lively Sunday morning in the sports centre Palestrina in Druisen.

They held an last day on Sunday January 24th 1993 in Orléans, Universiteitsplein.

we didn't have this info in time to publish the event before it happened - sorry! Hopefully Karl will send us a report telling us all what we missed. For more details contact:

Postbus 2 18300 Vlissinge, Belgium

New User Group?

5 years have passed in the meantime and rapid expansion of user groups around the country including the successful ITAG, SWG and WSWG. And now groups and you live in or around the Netherlands or Canada are now in your chance to start your local user group.

The group will be called the Netherlands User Group (NAG) for short. We're actually have a number of people interested and we plan to make the first meeting this spring at a venue in Northampton. For more details contact: Steve Harris on 04534 447100. Don't see 4534? Be contacted via the AAU list and 453000.

The AAU makes the group easy access and leads forward to finding the spirit of their first meeting.

WAG meeting report

Most members attended the late December 1992 event which was also the AAU. Nick Lock was elected as AG Chairman. Roy Dawes as Secretary. Norman Bland as Treasurer.

The final talks of Nick Palmer as ITAG, code writing package was shown off by its author. Brian Coward, report the release version to make users.

Devoes (belong somewhere they the thing new CD-ROM) was brought was an early. Happy Colin (later McBurn) had brought along an optical drive.

Nick Lock brought along a copy of Packer 3 but couldn't find anywhere to set up his ST. There were the Packer and an ST on the table so it was a bit of a squint.

A guy from Oxford had part of his ST housed inside a PC case, with the hardware updated to play with those System Software. Judging by the sample data presented from his ST's cartridge port he was into music!

The meeting ended around midnight and we used Colin's Hallway and Day start off in the bus stop to get everyone home safe and sound.

Thanks! I volunteered and verbally agreed with Roy to write this report. I have decided to stand for the post of Secretary at the next meeting. Hopefully you'll all support me!

STOS corner

Martin Milner responds to the call for programming coverage...

I intend to present some of the latest versions of the new releases which are under development and under review. STOS columnists will be reviewing beyond the README files which have resulted in powerful commands and features being totally overlooked for the most part!

It'll be taking a divided look at:

- Lee Greenough's CONTROL, extension which includes mapping and update commands for larger than 32Kx200 screens and commands for hardware writing on monitors with letters.
- Anthony Harker's Palace extension which have 128 colour graphics commands among others and Anthony Jacques' Palace extension which is also still under development. He is currently adding commands to provide a Palace specific replacement for the missing LTR rotation, although due to other commitments. It remains to be seen whether Anthony will manage to complete it.

Please do write in with any STOS related queries, you may have and I'll do my best to answer them. If you have, get my files and look for STOS programming. Contacted 4534 is as we can all benefit from your experience.

Jaguar jags on the Tiltboard

So you know, your program has ready support the jagged ripped pluggin' into the ports at the front left hand side of your STxTiltboard?

Use the jaggy command available in the registered version of the COM200A extension, in the jaggy command from Anthony Jacques' Palace extension.

However if you use these commands as a teacher without the ports such as the ST700 your program will crash. To avoid this check for the Condit for which is present on all STxTiltboards.

Using the 'codebook' command from Anthony Jacques' system control extension. If it is assumed there are HD output ports for DMA hardware for their history if the codebook is present you can test the _MAG module for DMA hardware and the _CPU module for CPU type.

Reducing memory requirements

Over 20 pages of how much memory pre-defined games use up the following:

Link is not just variable, but those look books don't tell you any memory! The solution is to use the linker extension to pre-define memory requirements. Control of your memory and display the required images on-screen.

How is it done? First of all, you'll need the Tiltboard extension by Ann Barker because you haven't got much for your system, you can't just display them in replace mode on the screen. You need to copy the relevant bit of background to a work screen (predefined) by the appropriate amount. Display your code on it and then copy that to the current position on your jags of screen. The linker extension makes coordinates from the

coordinates of 18 white codes

things more complicated and willough it will right copy your system. It won't work, it's not enough all the way or left hand side of your screen will hold crashing the machine!

It sounds like it might not even be worth doing, but the speed the linker copies graphics is so fast that the whole operation is so fast that it's hardly noticeable.

Looking further down it's actually run much faster than using pre-defined options and the linking link extension. So long as you don't have too many system on-screen simultaneously. There's an example routine for the Reader disk, taken from one of my own programs. It saves many kilobytes of memory. Used next time. ☺

Site seeing

Jonathan Nott visits a selection of Atari related websites...

STIK - THE ST INTERNET KIT PAGES

95%

[HTTP://WWW.FLINNY.DEMON.CO.UK/](http://www.flinny.demon.co.uk/)

ST Forum awarded this site maintained by Nicholas Flinny (Flinny), a formidable 1997 back when it was still far from its peak. Since then the pages have been revamped and moved to Demon.

The sprawling graphics and intuitive, clear layout of the new STIK pages have instant appeal and couldn't be much easier to navigate.

The individual pages are packed

with well-organised update and development information along with contact addresses.

Naturally the very latest versions of STIK, and all its client data, are downloaded with a couple of mouse clicks, making it the one stop shop for all your Atari Internet software requirements. A masterpiece of presentation and functionality.

STIK

GRIENIF SOFTWARE

61%

[HTTP://WWW.FAIR.COM/GRIENIF/](http://www.fair.com/grienif/)

A set of pages maintained by Grienif Software aka Dan Wilson. In addition to the main index page, the site also contains a Games FAQ and articles on Games and Macintosh from the Grienif archives.

The main page itself offers little more than download links, but at least these are in plentiful supply. There are links to both demo versions of all Grienif software products, along with all the patches to bring your Grienif

software up to the current version.

The vital ingredient missing from these pages is product information. Visitors are given the opportunity to download large archives occasionally, yet there's no information telling us what programs such as STalker and MacLink actually are. A few screenshots and product specifications would improve the site immensely.

An online order form and past issues of the Disability Rules newsletter are provided for future updates so there's plenty of potential. Currently there is more potential than content, definitely a site to watch though.

TOAD COMPUTERS

85%

[HTTP://WWW.TOAD.NET/](http://www.toad.net/)

The Toad web site has been one of the most established and well-used since the setting up its own, toad net domain. The structure of the site has recently been re-organised making an easier navigation system.

One thing the Toad site is credited for is the inclusion of many of her support areas on the site alongside the company's product information. This includes a US mirror for Joe Connor's Interactive site.

toad.net Welcome!

Bringing it all together!

The site can be very useful to all Atari users as all of their most product range gets a full covering on the site. It is always kept thoroughly up to date and remains very easy to use. This is a very pleasing site.

Reader Disk 3

We believe our Reader disks offer

outstanding value for money with over half our subscribers opting to receive the disk with the magazine. However, for those readers who prefer to see what is on the disk before buying they are available separately. Please refer to page 10 for details.

Reader Disk AG01

•CENTRO v1.0

Exclusive software Logon and Over Mailmap
Trillian to Star Trek in your GEM based desktop game

•SIB Codes v1.4

Freeware Mark Brown
CPX to hotel location from STD code and vice versa

•K232 Config

PD Martin Gabe
Base serial port problems using Cabling between Atari+PC

•ST-Guide v1.4a

Freeware Midge Woots
Hypercard driven, defacto Atari standard utility

•Applix v1.0

Freeware Midge Woots Midge's only Windows 95 style task bar and much more!

•Galls

Exclusive Shareware Gary Palmer
Monitors invite time with GAMES/ICE, Colloctri! TheComix MINTart and STIC

•Start Me Up! v1.0a

Freeware Thomas Mack
MightyMightOS only
Windows 95 style Start button and much more!

Reader disk AG02

•Thing v1.0a

Exclusive edition Shareware Amy Bellet and Thomas Bester
Proton Shareware Developer for TOS and complete operating system

•Crystal Atari Browser (CAB) v1.0

Exclusive edition Freeware Alexander Chaus
CAB is the leading HTML document browser available for the Atari platform

•STOS Compiler RA version v1.0

PD Ars Greenleaf
This STOS to run based tables for up to 11 different TOS versions

•AVR and STX format samples

PD Colin Moore
Samples created using format Digi Switch to encourage review
And more!

Editor's Pick v1.221P

Exclusive release

Freeware

•ZPC Software

Edith Pro is a commercial text editor originally costing over \$10. ZPC recently switched development to other platforms but finally released the final Atari version to Freeware. This is normally only available direct from ZPC but with their permission we are delighted to include it on this Reader disk.

Edith Pro offers features such as cut and paste columns you won't find in any other Atari software and it is a sized HTML document editor capable of using Martin-Eric Kacem's HTML BR2 file...

HTML3.2 BR2 v1.1

Exclusive release

Shareware

•Martin-Eric Kacem

It goes to creating HTML documents but collection is a gold mine

•Martin-Eric Kacem's longboard reference (BR2) file for use with Edith, Internet and other text editors. All the HTML3.2 and CAB v1.1 reference references are included

•Martin-Eric Kacem's standard RGB colour codes table which includes the standard hex values and solid colour names

•Kevin Werbach's Bare Bones Guide to HTML, which lists all the tags recognised by current browsers

•Bill Rousseau's SG BR2-1 Character Entities Table. If you're wondering how to add a personal sign into your document, you need this

Codezen utilities part 1

Freeware

•Matthew Baron

A collection of utilities programmed in BASIC BASIC v2.10 including screen editor, menu and more.

HTML tutorial

Exclusive

•Neil James-Rodney

HTML, Internet, file and GIF to accompany tutorial

Atari Computing Database #1

Exclusive

•Norman Black

Atari Computing's own database guide to AG01 in ST-Game format. Includes comprehensive vendor and who's who guides. ST-Game was included on the AG02 Reader Disk.

STOS linking

Exclusive

•Martin Milner

Best tool to display a single image file in the correct place on the logical (background) screen, ready for the camera, snap here in the program. STOS sprites could be used instead of icons

UVK Demo v0.5

Richard Karamanos

The Ultimate Virus Killer is the best rated virus killer for the Atari platform. This demo version has the following restrictions:

- You can detect viruses but cannot kill them
- You cannot unarchive disks
- Bootsectors which can be restored cannot be written to disk
- No advanced system status screen for memory analysis
- You cannot repair damaged BIOS parameter blocks
- Not MultiTOS compatible
- No manual, online help, ACC, CPU, service or support

The full version reliably removes these restrictions and includes additional features

Videl Inside v2.02

Freeware

•Tritonware Development

•Free, old GALLA aka Arkham

Freeware software only resolution emulator which only requires around 1 MB memory. Includes video mode editor

CADENZA UTILITY COLLECTION

Utility
Freeware, all Atoms

60%

This software in this collection are the first efforts of programmer Matthew Bacon. They are all written in HiSoft BASIC v3.0, all freeware and, most importantly, all include the source code and support files. This unusual step by the author should encourage other BASIC programmers to learn from the source and go on to develop their own applications.

Autolock v1.00a

Autolock is a simple, but effective way of setting the system date and time. A nice feature is the status of choices, which pop up when you click on some fields. For example, the day field (under a refreshing list) as an alarm option can be set to display a pre-defined message at the preset time. One down side is the number of other programs which do the same job (including LOCKDOWN and Firewall under MagIC). It also doesn't appear to support years beyond 1999.

Calc R v2

This simple calculator accessory works well enough, but it would have

been a lot more useful if keyboard support to enter characters had been included.

LockOUT v1.04

This utility provides an effective way to prevent casual unauthorized access to a computer while you're out of the room. Call it up before leaving, enter a code and press the Lockout button.

The computer can't be used without first re-entering the password (apart from rebooting, of course). It would have been better if the program could have disabled the ability to reboot via the keyboard, but of course, if you know how to do this, then you'd also know how to use the reset button, etc. Preventing use of the computer after a reboot is the job of the next little utility.

Password v1.0

Similar to LockOUT, this program requires a password to be entered before the computer can be used but this time at system boot time.

The disadvantage is the password is hard coded into the program, so you either have to edit the program file or - if you've got HiSoft Basic - change the source file and recompile the program. It would have been a simple matter to store an encrypted

password file on disk, so maybe someone will add these features maybe Matthew Bacon!

Print It v1.0

There are two versions of this program: V1.00 allows text files to be printed out using different fonts/sizes etc.

The only disadvantage is when dragging a file onto the desktop icon, it doesn't automatically open the file ready for printing.

Print It v2.05

V2.05 performs a different task. Print It allows different control codes to be defined for different printers and saved as files to printer drivers. Such files containing pre-defined sequences of control codes can be defined to configure your printer but doesn't actually output files.

Conclusion

All the programs were designed to be colour depth and resolution independent (even ST means resolution upgrades (although they may lose in ST low/medium some of the things many appear equivalent with some objects in the wrong position). Overall an excellent first effort by a new programmer who deserves encouragement in the expectation he will go on to produce even better software.

Markus Asher

ANTMAIL V0.70

Communications

Freeware, all AtariS 1MB minimum, ST medium or higher

76%

AntMail is a convenient email application developed by Dan A. Jensen which uses the STIR internet connection software (also developed by Dan) which takes care of the online details which just leaves setting up AntMail using the minimal documentation provided.

This involves creating a mail folder using the Create New User Folder option under the Extras menu. The file selector appears ready to select the path and enter a mail folder name.

Next, configure AntMail selecting each option in the Config menu to turn. My Internet Service Provider (ISP) is CIS and my settings are as follows.

User Settings

User Name: Enter the username you agreed with your ISP.

Password: As supplied by your ISP.

Save Password: Tick/Un-tick this to password protect AntMail and prevent casual access to your mail.

Mail management is easy, look just path from these options.

VIDEL INSIDE 2

Utility
Freeware, Falcon only

70%

Videl Inside (VI) is a compact and easy-to-use video mode enhancer utility programmed by Francois Gales also known as the Tiscorn Development group.

To install VI two programs have to be added to the Atari library. On startup, selecting the Videls icon from the Options menu displays a selection of screen resolutions. Select the desired resolution

Mail Address: As agreed with your ISP (same as InternetMail configuration etc).
View Mail Folder: Once you are all setup with Reply To Only needed if you want to forward mail to a different email address.

Clicking on Send mail to Dan sends the authors address.

Set Mail Folder: Select the path you set up under Create New User Folder.
Set Key File: Select a file to be automatically appended to your email (typically an ASCII text file containing your signature contact details) then click on Yes New.

Server Settings

Pop Server: As specified by your ISP (same as mail configuration tag).

SMTP Server: As specified by your ISP (same as mail configuration tag).
Leave Mail on Server: Tick/Un-tick. To automatically delete messages when email select No, make your selection then click on Yes New.

Program Settings

The last three options Use Vertical Lettering, Use New UI and Icons Window Redraw can all be toggled between Yes/No, then all details to No and those which work for me are

Videl mode editor

10 video modes can be maintained in order in the options settings for your Falcon computer (available to be maintained).

Once you have determined which video mode you wish to use the editor to increase/decrease the settings for this resolution. Load the editor, select a video mode then works, click on New mode and a copy is added in the end of the mode list. Work on the copy because once added there is no way to revert it.

Increase the Fields per line and

Horizontal resolution, checking regularly using the Test button to ensure a just white box on a black screen is displayed. After setting your desired horizontal screen resolution is just the procedure for the Lines per VHS and Vertical resolution.

If like your favourite text editor, no learning curve required!

Click on the Select Mail Folder and Select Key File menu to select the path to your generated Mail folder and the window using the file selector then click on Yes New.

Next select the Save settings option to save a DEFAULT STIR via the file selector (OK button) and finally select the Save Preferences option to preserve your settings for future AntMail sessions.

The documentation events collecting and sending mail via STIR, along with advanced features including multiple mailboxes, but not a basic setup functioning correctly first.

AntMail is a solid performer offering all the mail options and reading. The online phase is performed reliably and works well to pass a range of Atari mailboxes and under Mail.

To the end is to select the online dialog because there is a lot of mail and a better screen look or maybe a link to no screen utility but overall AntMail gets the job done.

For Charles

VI also supports virtual screens, making a resolution larger than the actual screen can be used and scrolled around all for displaying large images etc.

VI is freeware, which compared to the commercial hardware resolution enhancers such as ScreenMaster or SuperVid, is a good cheap initial step to try. It offers video modes can be fine-tuned, increasing and saving refresh. Used together with ScanMaster VI allows larger and more stable resolutions but doesn't seem to work properly in TrueColor mode. Overall a definite improvement over version one but needs further development.

For Charles

SUPER TETRIS

Games
Shareware, any Atari ST/STE

85%

Apart from being an excellent Tetris clone this version includes lots of nice extras which enhance this classic game without spoiling its elegant simplicity. All the classic features are present and correct including the ability to drop bricks and lock them under other bricks without which any Tetris prior quickly becomes tedious. In particular the screen shake is fun but the main additions are the 'Specials'

- bricks with extra abilities. Here a full selection of bonus points, speed up, slow down, ghost, dis-ghost, levitating, heavy random, rise, well and cool level. It's still working up way up the 50 levels and the sampled sounds add atmosphere missing in other versions. The manual guide them to make the early levels fun too.

Unlike some other clones Super Tetris makes good use of the entire screen

and ideally these should be optional. I really hope Tetris is the last Tetris clone I've played on the Atari platform.

A level editor is included to design your own levels or edit the existing ones. If you find the game 'Boreman' can also be added and there appear to be more things in the top left of the screen during play.

The full version costs \$15 has 50 levels plus 18 bonus levels and no options and extra level sets compared to the share version.

COPS V1.05

Utility
Freeware, all Ataris

87%

COPS (short for Control Panel Server) is an XControl replacement. COPS is usually distinguished different from other XControl replacements such as XControl and Freedom II both of which have stuck with the XControl scrolling list approach. COPS displays CFS modules as a table window as icons and can display an entity window as you have installed. COPS uses less memory than XControl (or the competition) and can be installed or start up if desired.

A right mouse click on any CFS icon displays a popup menu which the CFS can be enabled, disabled and configured via the left-right mouse button anywhere else in the COPS window displays a popup with options to help up the icons as they lie easily in the window, call the ST-Quote format editor help, set the CFS path and configure COPS itself.

COPS expands the screen position of each CFS module and opens it up at the same level as each time. Support for long filenames with spaces means a CFS module called 'MyCool Configuration Tool' could be loaded from a folder called 'Control Panels'.

With COPS installed as an application to open a CFS desktop which understands the 'X_START' message (MagiData Thingy) can be used to launch CFSs by double clicking on their Desktop icons. Thanks to Atari CFS modules have an 'selected' icon (the mark on entering) but once loaded on a desktop (all colour icons can be assigned to understand CFS modules).

COPS was programmed by Thomas Mink and the Helix brothers. To use COPS with TOS you need to install WDALOG PRO in your Auto folder. WDALOG is a compact system extension which adds support for windowed dialogs, popups and toolbars along with a complete header extension of icons. These functions were integrated into Magi from v1.

Despite the fact Maggio are not part of the 'trade', determined members of the team managed to get into the European Computer Trade Show

This month we feature a selection of articles (including one written by Massimo O'Reilly, best known as *Rykie*) (the graphics artist from *Absence's* *Code*). His graphics feature in both the *Maggio* *Photo* and *MTW* (soft and cheap). *Maggio* is not an exclusively male domain. Last year I managed to get into the European Computer Trade show (held twice yearly in London, in June and at the Japan venue - before it became widely available).

Finally there was a revealing report from the *Maggio* 5th birthday party - written by Mike Rogers, who has also written many articles for *EG*. Next:

By the time you read this we should have changed our Internet Service Provider (ISP) from Deimos to Eutels but for the foreseeable future at least, our web pages remain accessible at:

<http://Maggio.cjb.net/~spoon@egmagazine.it>

While going to be based around the Lyons 1000 5+ at the show and we were also in the meeting but a feeling as the *Comdex* like PC Fair - all as well as Italian - point your finger at the show.

Richard Spooner and Chris Holland
The Maggio Team

Maggio have released many different kinds of events - all in the name of being a good time and to bring news of the latest developments in the PC world.

The first of the party included the European Computer Trade Show (EGTS) and watched Alan trying to convince the editorial team and press how marvelous the *Magpie* was. Their efforts from our side (and you) gave a lot of time to the show.

The spring '95 EGTS proved to be the largest such show yet with its own home at Olympia providing some much needed office and meeting space compared with the equivalent of the previous show in London.

As you might have expected, the latest showing of the *Magpie* and associated new games on show for the first time at the show were our top priority in planning content for the two previous EGTS editions. Alan decided to splash out on a proper stand with a large showing of our games in a stand central to their point in the well thought out approach of the previous spring show - where we were truly delighted and pleased if you go back to see the last of five games then in existence - or the 1000 5+ all approach they developed for the Italian show. Having some money to spend, and some product in-house we decided provided the exhibition Alan wanted to attend the PC 7+ at home at last.

In the new the *Magpie* 1000 5+ drive was coming to UK retail and several with were available up and running showing several pre-release games. Despite the thoroughly busy Trade Show platform we enjoyed the day and it was indeed a great time at the previous EGTS and it was indeed a great time.

Over to the UK - some time the new version of *Photo* and *MTW* got to

have a go on the big screen. It is certainly a challenge compared with the PC version but the basic rule was comparable and (probably) equivalent.

Then Lightning. Despite being a somewhat (CART) game, it was a bit of a challenge to get it to run. There's a lot of code under the hood but it was a bit of a challenge to get it to run.

I did get my hands on a very early version of *Code* but the *Magpie* 1000 5+ drive was not in the show. This is a first for *Magpie* or *Absence* - style game which is a first for the show. The graphics engine on this could not even show a game. This was a first for the show. The graphics engine on this could not even show a game. This was a first for the show.

Highlander arrived very much in the same way as *Alan* in the show, but it was a surprise to see *Alan* in the show. The graphics engine on this could not even show a game. This was a first for the show.

We collected the hardware and software and got into the show. The graphics engine on this could not even show a game. This was a first for the show.

The *Magpie* 1000 5+ drive was coming to UK retail and several with were available up and running showing several pre-release games. Despite the thoroughly busy Trade Show platform we enjoyed the day and it was indeed a great time at the previous EGTS and it was indeed a great time.

Over to the UK - some time the new version of *Photo* and *MTW* got to have a go on the big screen. It is certainly a challenge compared with the PC version but the basic rule was comparable and (probably) equivalent.

This final major work by German super-group Absence is a good one. Unusually for a demo of this type it fits onto a single high-density (HD) disk and uses a hard drive or large RAM disk. The demo loads you into a world of snow, rain and clouds, with a great soundtrack which seems better suited to a more dynamic series of demo effects than the ones we've presented with.

As requested, the standard of presentation is of the highest.

Chris Holland reviews the Joint Venture, Absence's final freeware demo on the Falcon scene ...

standard and makes well with the apparently flawless coding. Several of the effects and textures really do stick in the mind and the demo ends with an unmissable possible scene with rain, ripples and water. This demo is different from the previous demo in that it is a real demo - a real demo - a real demo.

Maggie party

To celebrate the fifth anniversary of Maggie, a coding party was held. Michael Noyce tells us how the day went...

Most of this crowd, gathered at Croydonian 96, attending the Maggie party I suppose was official guests invited to the party held at the 96 on 10th in Southdown Meadows at which all kinds of events were planned. The biggest event was to be the release of Maggie 18 and the new Falcon-specific shell courtesy of Reservoir Gods. I was on behalf of Richard Harrison, who couldn't make it in the end, as a contributor to this new dimensional shell named ST News.

An early morning start meant I had to change my mood. So today morning I'm in bed. Unfortunately I woke at 7 AM after a few hours sleep and by 7 PM I was at Croydonian 96. I walked through the rain to Wellingborough. At Wellingborough I was waiting for Chris to turn up, whom I contacted (I don't know what the leaders like that were) after several minutes looking at each other we figured it out.

After a short, but drive to Southdown I was dropped off at the Palace Hotel while Chris went off to fetch James Power Matthews. The room where the party was being held was a difficult to find and once I was with the other members of the party I got no way to a car and started to struggle to find I could which meant sitting next to the famous Reservoir Gods. Someone eventually talked to me, and this turned out to be Richard (John Power) who turned out to be a bit of a bit. Minutes (that looked) I was too tired to hear some people feedback from a fellow Alan about my article (in fact, ST News and Maggie). I was shown some Falcon demo which left me unable to speak words other than Gods or Amazing, which resulted in me having a mean about my financial life in case preventing the purchase of a Falcon.

I was shown the finished house of Maggie 18 on the ST with the Falcon shell and to be finished later in the day. Richard was too much to turn out a Coke and I made a few games at the impressive new Falcon shell as it was being worked on. On the other side of the room some guys were involved in a battle over computer, so I spent some time looking at that. Chris returned with the news that James Harrison (Top Flyer) had got lost in Trondheim which resulted in some moving a thing throughout the day and into the night (even though it was also disappointing for Chris) as it is the most because he was expecting to show all some new Top Flyer software.

A recent ST with Maggie 18 looked just as sitting in front of it, having a close look at the contents. Besides that, Richard was at the keyboard of a laptop adding to the machine while (which appeared in Maggie 18) it was a long time before I could finally copy back at the Reservoir Gods. Falcon some of their other stuff was being demonstrated. Double Double 2000 was and some very useful to the needs helped. About the party it has been released as a game and is still doing very well. Under a copy today.

By and all around people had come and gone. Maggie (Lynn of Impact Software) had written with a copy of Tron, which was loaded on Reservoir Gods' Falcon while

they took a break from riding. With players began looking being broadcast by the radio in the main things reached a few point, partly due to the revolutionary electronic lens.

At some point during the afternoon a new CD drive arrived for Chris. He was rather excited by that and it was quickly set up on an unused Falcon in the room and we were soon browsing cool music.

My attention wandered to some people playing a battle on a computer machine rather badly. It has to be said I decided I'd there was time to spend for them and though I say so myself I did a pretty good job of showing it off. Well, at least get onto the second world.

Leon O'Reilly, Mr Pink of Reservoir Gods, enjoys Neurobotix a new Falcon only there were game...

Neurobotix is the first release from North Coding from Northdownian Software. It is a platform game which is more the Falcon's 2D mode made. The plot seems straightforward: you're a large robot and you have to shoot things down a good rope for a short time up again. The action is huge and the whole thing has just some scrolling through some jumping platform levels.

Despite being new to Neurobotix, the game (which I can find in your reports) and the graphics have a home-grown, amateur feel to them. But this somehow adds to the appeal of the game. The computer sound (FS) are surprisingly loud and clear. This game is obviously not a suitable general replacement for the author is focused on and supporting the Falcon in the meantime by maintaining your copy. Neurobotix remains one of some classic 2D games you've not quite read of what you're supposed to be doing. But it's a fun thing. Get it on 10th.

As evening approached, the rain turned once again to misting at the new Maggie 18th. All the people at the party with digital and paper and some who's who's a good night. Some people came and went as the evening proceeded and eventually the temperature started to go down as well. Quick reflections appeared in the new Falcon shell version of Maggie finally appeared on the screen. Things went down a bit shortly before Richard.

Neurobotix disappeared to show how things were going. After that, several very tired people left and bed.

I make early morning and after Chris arrived back, someone was up and about by 10 AM, continued with eggs of tea and coffee. Breakfast and the form of a birthday cake that had been bought for the occasion. It was really nice!

After some more playing and reading it was my turn to have with a bit of Reservoir Gods. After dropping them at Northdownian, Reservoir Gods took me to Wellingborough. News where we party.

I walked home and had a good night. I had a shower and a hot good night and I felt much better. I thoroughly enjoyed myself over the weekend and had a brilliant time. Hopefully we'll do a game sometime in the near future. ©

Scoring with Cubase

AtariPulse #4 saw the beginning of a regular MIDI page by Owen Philip. This was supplemented by the first in a series of Music in MIDI articles based on the musical notation. To complete AP's first step into MIDI we featured an article by Keith Towner-Greene (of Cubase CD fame) and this is the article for Cubase selected for these pages.

The article was too long to include in its entirety - one of the advantages of a magazine is that the ability to fit articles into its finite natural length. Hopefully the article does divide neatly into sections so the Performance version has been split up and included on the Reader disk. We really hope you read the complete article in AtariPulse #4.

All issues of AtariPulse are available by visiting its MIB, check out two strings per issue, our last release page on towards our costs to £1 (Printed Matter) Wholesale £0.85 (R2R UK) England.

Don't forget to say which issue/s you require! The current issue can also be read online or typed from the website addresses below. (Please note our recent address has changed.)

Read ataripulse.co.uk magazine on

AtariPulse #4 should be published towards the end of February and will be (as usual) full of interesting features, articles and reviews.

Including two new featured columns: Mike Winny starts as HTML related and Robert Coleman begins a BASIC coding tutorial. Adam Foster continues the POV scripting tutorial and Ben Boudewyn's finally gets to publish his archive feature (discontinued from AP#4). For Polish owners we have our own review of Notepad and Dorewell Gode takes a look at the first of Frey CD.

Colin Fisher-McNair

Producing scores is a state of mind. There are rules that the purpose of the score is to get a player to play what you want. It is up to you to be clear and to understand what players and instruments can and cannot do. Most players can play with a few technical notes, but they cannot read your mind.

Simple directions are useful. For example, use English instead of the proper Italian expressions. Things like, slowly, fast, really smoothly, dance fast and so on really help players understand how you like your notes to sound.

It is in writing the score from the players point of view and Cubase is perfectly capable of handling this.

There are some common mistakes which typically lead these way into scores so let's take a look at them first. Your understanding of each scoring problem and any constraints will affect the final result - and its playability.

Dynamics

Don't go mad and add to every dynamic change (because you'll end up with a real mess). Alter the major dynamic events and group of positions markings and leave players to go with the feel which, so long as you have marked the overall feel, should be enough.

Now you can double-click your dynamic markings and alter the mark data. Cubase has two types: Precise Crescendos (double-click a Crescendo marking) and Precise Accents (they don't gain accents that is a mistake, they mean Dynamics anyway, double-click a dynamics marking).

TIP Cubase Score includes a function accessed by double-clicking a dynamics symbol which allows the mark data within a range to be altered. None of it we need to go through the entire arrangement and make all notes maximum velocity. To do this use the 'Select All' button in the Arrange window followed by the Transpose Velocity selection in the Piano Roll Menu. Set it to 127 then click OK.

The recommended settings are set up by default and they're almost right, the thing that you will get is almost real whether your dynamics are close to your requirements and fairly sure players will go close, assuming they are blessed with ears.

Don't forget for Microsoft Key Shifting it does called starting dynamics events then an ALL MARK IN MIDI.

Staccato, Pizzicato and Harmonics

The use of the Microsoft started to frequently together when scoring. Basically the player will play the note in the score by about half its written length. Often this is very useful to clean up the score. Most instruments can make very little difference between a quarter and a staccato eighth, so by using staccato eighth notes (half bar below) instead of quarters and quarter notes (half bar below) the player looks much cleaner. Using players' brains to get this.

If you need to change the mark data to make the score easier to change at any moment, you can still get Cubase to play a shorter note by entering 'MIDI Notation'. This function is designed for the very purpose. In the Dynamics menu on screen will select MIDI Notation, click the arrow button and after the edit up as shown here. Now Cubase will play all notes with a staccato symbol 50% shorter.

With pizzicato, double-click the mark to a very quiet where the difference between a pizzicato quarter and a pizzicato eighth can be heard (especially on cello) there is also little good having notes sounding the square between notes. (Half bar below) The notes may as well all sit at the top again (half bar below) as a string player will tell you that they can't play a long pizzicato note anyway, and it looks much cleaner.

One night after in the Cubase manual (chapter 1-4-5) shows a small code in the symbol to go above the note to represent 'Pizzicato' in the symbol. I pop-up menu. Most players now use this to indicate 'Pizzicato' with 'Pizzicato' written in a point, and combined with the written 'arco'.

TIP Don't forget the [staccato] key! Holding it down while pressing [any] symbol (in fact any symbol) will cause notes that are held over to be released very quickly.

How

the system on standard part of the playing. If you are a guitarist, start when the note is placed and open over the fretboard and accompanied as or pulled off. All instruments have the same principle, but different methods.

Strings and the bow at the beginning of a note that keep the bow moving throughout the note until the [staccato] key is pressed when notes have to play very fast the staccato the available time in the star is because the player tends to have fast or with greater precision to produce the notes. Very good players can have better timing (between the middle of a star without any delay) because to the sound but not time to decide if it is worth making it.

Time production on all wind instruments is [staccato] by the player forming directly the syllable in. This is called [staccato]. The first note under every star is [staccato] and all other notes are [staccato] individually. Again, remember more notes requires more time (as does) expect a wind player to be able to take a long staccato phrase or high release to staccato.

TIP If you are good at programming your notes and responses you can set up a window to edit the start point of the second star so as to close the [staccato] before and after every desired star can't vary but the notes released in words, the effect.

Keyboard players, especially pianists, can't always do much about this because every note has to be played with the same hammer action. On analog (synth) instruments, however, some of this can be used to the advantage to enable stars to be played. Modern keyboards are getting past this type of limitation and in the next version of Caress an [staccato] key will be added to the keyboard.

The other reactions to the rule are [staccato] (piano), the [staccato] (piano), and the [staccato] (piano). And if you want more [staccato] and stars for the instrument because the player really has to imagine every note. Using the [staccato] is practical and sometimes very useful because the purpose of the

star is NOT for making already played (see Transposing later) that of the time the first star players can do it is [staccato] it is used instead of a "T" to effect the staccato of the note.

When starting for almost all instruments stars are still the experience. The [staccato] on the Caress symbols means the star and the look about the star the star are for better stars.

TIP Remember stars can take any instrument. Caress has a [staccato] key. It's slower for this (and many other symbols). First select the group of notes to be edited for star by changing a fast star then, don't worry a few stars select other available stars such as the staccato and so on. Caress ignores stars.

Now select the star symbol from the symbols menu, press [staccato] on the keyboard and a [staccato] star appears. This can really speed things up the [staccato] method can be used for [staccato] [staccato] etc. Take care not to hit the [staccato] key which is uncomfortable and in the [staccato] key.

Transposing Instruments

Many people later with scoring for these instruments and some modern instruments are usually found in a no longer standard. An instrument in B flat (Trumpet, Clarinet) will sound a B flat when the score has a C written. All instruments have a key, for example, a French horn in F refers to the note they sound when you write C on the score. From that you can work out what notes to add to the score to get the desired sound.

With Caress this presents a problem because the star data in playing your sound device, but the score needs to be transposed. There are two ways of getting around this.

1. Use the Staff Settings Display Transpose to edit the display to the correct amount of [staccato] where or below the actual scored pitch. A box is included in a pop-up menu or you can edit the display Transpose box yourself. Don't ask me why [staccato]

only included pencils for trumpet and alto, tenor and baritone saxophones for the instrument table for a more complete guide.

2. If you intend to regularly score for brass woodwinds and saxophones etc. then use the usual permanently in post sound generating device. That way the star data will always be correct for the score and the device, although it will play based on other people's devices, not to mention your keyboard playing!

However, it will help relating to players in the library. Don't expect to have in the opposite direction from the chart above this.

Parts and Measurements

First, the best looking and efficient Page Setup setting is shown here: the [staccato], [staccato], setting, making the star appear only on the first line of the page, and the [staccato] bar line, setting, will help to make the notes stand out more, especially when output to printer. For both settings and make your own about up.

Most parts will, with all parts appearing, now easily be scored out by using the star legend function. Set the number of stars per line in the Global Settings. First, a high number (around 10) seems to give a reasonable picture.

Individual parts are quite a different matter. Often they are more generalized than the number, so all though the music is supposed to be the same. Usually only the notes for one instrument is indicated but they can be right, for example, two strings on the same staff, leaving the players to sort out their parting notes.

For example, one score (Clarinet) has (normal) in addition to written notes for the instrument they can be used for the players reference, so to let them know what other instruments come in. Don't be afraid to add dots, especially when there is a repetitive section, put on a bar count where there are more than 4 bars and make sure there are 4 bars in every 4 bars the notes and use a different font to distinguish them from musical instructions.

Most important is page format. Allow at least two lines of notes at the end of the page if players are expected to turn the page themselves. This can be a nightmare! There is a reference section on the Reader disk which explains how to score for some of the most keyboard instruments. The instruments covered are the French horn, trumpet, Violoncello tube and drums.

Bill Turner-Caress

INSTRUMENT CHART EXTRACT

Instrument	Staff	White	Black	Grey	Key
Flute	B	C	C		Flute

Violoncello (Solo)	Bb	C	Bb	C	Flute/Violoncello
Violoncello	C	C	C		Flute

Calamus on the Mac

With the demise of Aldus as a computer developer, their once-dedicated users have had to look towards other platforms for the latest developments. The Apple Macintosh and PowerPC have been a natural choice, and the wisdom of this decision has been underlined with the advent of the Map/CMac and PC/DOC emulators.

In keeping faith with the growing number of users who are migrating towards these platforms, we have extended our support to include those using Calamus in conjunction with Map/CMac. A PC operating system by adding both platforms to our own at-home systems. Whilst in the main this has been a simple process, there have been a few hiccups in the process, and we hope this article may be helpful to others intending to follow this path.

Which Mac should I go for?

There are two avenues open to a potential user wishing to migrate to the Mac and use Map/CMac. Firstly there is the original range of Macintosh machines leaving the Motorola 68000 family of processors at their heart (known as GKR or Mac classic) and include the 5000X, 505 and 505X chips. The second chance is the new generation Mac family, the PowerMac. These use the Motorola PowerPC chip which actually simulates the GKR chip. Whichever machine you choose, both use System 7 which Map/CMac requires) will require at least 16Mb of memory, although 32Mb appears to be the standard starting point especially on the PowerMac.

Thinking my way through the latest Mac range I have found that the recommended price for GKR Mac seems to vary between about £200 for a Mac II with monitor (68000, 1Mb RAM, 200Mb HD) to £700 for a Quanta 5400w with monitor.

The machine I purchased was a second-hand Quanta 5400w (Apple/Apple), which has a 68040 processor running at 60MHz, 16Mb of memory, 500Mb hard disk, a 4x SCSI CD-Rom and a software the latest version of System 7. According to my sources this is the latest GKR Mac made and easily equals the Motorola 680 (PowerPC) chips in performance. The only additions I had to make to the system were the purchase of an Extended (full size) Keyboard and a two button mouse (none on the list), both of which are required to enhance the use of Map/CMac and most of the Aldus packages used.

All Systems Go.

So, you have chosen your Mac and you're ready to install Map/CMac onto your system. This is a simple process which includes the adjustment of system settings such as colour resolution, selected drives (including the internal CD-ROMs and external drives), modem, printer and memory allocation all of which can be re-defined as any time thereafter (see Fig 1 below). Whilst on the subject of drives, particular care must be exercised by creating folders within the Map/CMac folder. For example, a folder called "C: Drive" will sit at the root directory where the Aldus folder (containing Aldus programs) and Desk Accessories can be placed and not-mounted (as with C partitions on a normal Aldus drive).

By now you should be up and running and you can start copying files over. This operation is as easy as inserting a disk into the drive and is assisted by the use of an available System 7 utility called PC Exchange. This utility allows the Mac to read and write PC files via any PC formatted drives including floppy disks formatted on the Atari 1000 (4 & higher).

Once all this is done you can start to familiarise yourself with the new environment. For anyone who uses Map/C on the Atari they will find very little difference between it and the Map/CMac version, even the file built-in version of Base will hold no surprises. However, should you wish to use NYD, then you will need a special version to work with Map/CMac. As with the Aldus version,

this version optional extra speeds GEM screen redraws and offers the use of vector fonts technology. In addition, NYD for Map/CMac can also utilise the Mac's own TrueType fonts and allows the use of higher resolutions. Whilst NYD, Map/C is limited to working at only 640 x 480 in 126 and 32,000 colours or 640 x 400 in 24-bit colour-depth. Another reason for including NYD on your system is to assist printing. As the Mac uses its own method of printing called AppleScript, NYD offers an avenue to print from within Map/CMac and supports a large number of AppleScript printers. Alternatively, if you wish to use a parallel printer with the Mac, you will need to invest in a Power Print cable. This is an AppleScript to parallel converter and allows PC/Draw compatible printers to be used by both the Mac and Map/CMac. This is a necessity for anyone using Aldus applications which utilise their own printer drivers such as Calamus SL and DA Writer/Layout.

Calamus OK.

As you would expect, using Calamus SL on Map/CMac appears to work just as well as it does on the Aldus. However, once you start using it within the true colour environment, you will see how good Calamus is at what it does and your colour set work will appear so much crisper, with vibrant colour values. Printing from within SL also presents no problems, especially when using a parallel printer via Power Print with the Interlock settings within the

Fig 1

Print Designer, switched to 'OTHER'. However there are a few problems when it comes to using AppleScript printers, as SL does not come with suitable printer drivers. Don't panic! there is a solution at hand in the shape of a (rather costly) PNM printer driver from Adobe Systems (see page 6 of Calamus User).

It is not until you start using both scripting systems that you discover how powerful they can combine to. A good example was when I output a Text frame containing colour text as a 344x544 colour Photoshop file at 72dpi using the Bridge module. I switched to the Mac environment where I started up Photo Shop and opened the aforementioned file. Once loaded, I started to experiment with several of the tools and special effects (see Fig 2 below). Once I had finished there, I saved the resulting artwork back out as a Photoshop file and re-imported it back into SL (see Fig 3 opposite). After processing the frame through the StarScanung module, SL printed the document to an Epson Stylus Color whilst making use of an impressive printer.

As I mentioned earlier, I had to purchase a two button mouse. This I found to be a necessity, particularly when using Easy and SL. Life is so much more difficult when trying to work with Apple's own one button mouse. The mouse I opted for was a Kensington Thinking Mouse which actually has four programmable buttons and is by far the best mouse you can buy for use with MagicDraw.

Useful Additions

If your wallet won't extend to a copy of Photo Shop, don't despair. The Alternated, Photoshop from Systems

Solutions often carry similar features all at a fraction of the price. In addition, the Mac has plenty of equally competent shareware packages which can do the job. One such program is a graphics art package called Graphic Converter (you see I do). It not only handles all the major PC and Mac drawing/vector based formats but also many of those used on the Atari including, surprisingly enough, the colour and even Calamus vector files. Unfortunately Graphic Converter can only handle CMYK files on output but this useful program is a must for anyone using graphics.

What else will work?

While this article looks at using Calamus SL with MagicDraw, I felt that I couldn't finish without a word on some other programs that will work. So far apart from SL, I have used BR, Vector Pro, Drawing Art 3, Type Art, Paynes Gold, Superline Professional, Two-to-One, Silver,

and finally without expounding any major problems. However programs such as Calamus 1000-99s will not work even though MagicDraw can support Atari to resolution (640 x 400) at 2 colour.

A word of warning.

On a final note I must warn anyone thinking of importing to the Mac to stay well away from the Compact Mac. These machines use the 68000 processor and offer only limited memory expansion, so that MagicDraw users will experience no rendering benefits over the ageing Atari machines. For more information contact Systems Solutions.

In the next issue I will be writing about my experiences of using Calamus SL with Magic PC as, as they say, watch this space!

How to set up MagicDraw

MagicDraw on Atari (GEM)
 1000 for MagicDraw £195
 MagicMac 2 1700 £150
 Power Plus Color £160 or less
 Kensington Thinking Mouse £34.95
 Kensington Revolution Mouse £39.95

QUESTIONS & ANSWERS

PC 100 for me?

Q You sent a 133 MHz module to be tested in standard Peltan casing which came in a surprise to me because I have had a Quantum Memory 1400, 133 MHz drive from my standard Peltan case for almost two years now (powered by the Peltan power supply). It is reasonable actually I had to cut one of the plastic mouldings for the case across and modify the 133 drive mounting bracket and buy a 133 to 55 MHz adapter which included a power plug and lead. To date I have had no problems with it and this sounds quieter than the 65MHz module that came fitted in my Peltan.

Steve Wilson, via the Internet

Crash Landing Falcon

Q I have been very happy with my Falcon, but recently I have been having no memory but boots. The final program I run drops off with a low beeper and I quit although subsequent programs run without any problems at all.

Stanislav Krasovskiy, UK

A There is no default answer but there are several things to consider:

- I look between Auto folder programs and/or desktop accessories. To find the culprit boot up without any programs and add them one by one until the problem reoccurs.
- I try deleting/cleaning your RAM/ROM. If the latter has the directory of your boot drive/partition and running the SW file which runs before boot compound.
- If you're unlucky it may be a hardware fault.

Gregory Markov

Junior Posting

Q I am having trouble getting Junior office to work. When the module loads in a dows I did notice it makes a long beep and then and I have set up the configuration file and the Class 1 Pin MTR file, any idea what I could be doing wrong? I have set up all the channels in the address bar and the Network card is set to ATD.

D. Diamond, Australia

A This seems to be the most reported problem with Junior Office. You need to set the module dial-string to:

Module/Configuration/Module to "" (an empty string) and all should be well.

Steve Taylor

Junior Posting 2

Q For just got a UN Robotics 1016 exact fax modem which doesn't seem to do anything. My older modem based fax with JCF The fax light flashes but it doesn't dial.

Steve Goldfield via email

A Your new modem may support a different fax class than your old one. It supports both Class 1 and 2 you should see Class 1 by preference. To test this type AT+PCMA= as a standard window or alternatively get SPCSWA (programmed by TCM) from a PD library.

Steve Taylor

Hardware Specs

Q I installed Spectra on my laptop and was initially impressed as there flickering on screen while viewing SPOT Information's site. I work with a FLUCCID player on a DSP media program from RTH/TEC so I had to search it out. Maybe it is a problem with the vertical refresh rate the software is set to drive?

Karel Bone via ECT

A The VGA sync bug is an annoying problem where the Falcon produces two or three vertical refreshes overnight on every monitor refresh. Instead of just one, it does it after all Falcon/VGA combinations but seems to affect many cheaper (if VGA) systems.

If you can see tiny flicks near the top of the display your monitor is affected. More annoying than problem sometimes with the timing of graphical applications such as movie players, games and any program where the vertical refresh is an important factor. For example it is prone to happen on 60 Hz monitors and it looks like a pretty 100 MHz hardware. The game was at 100 MHz the expected frame rate which was off.

It also interferes with image servers (for loading files) and the reason is programmed around it in software. But there is sometimes hardware alternative to using Spectra.

GGI Alert Computing does not accept liability for any damage that may arise if you decide to perform this modification.

• Three way Syncs. It only works with G200 card.

VERTICAL SYNC PROBLEMS

A year old LGI system, works to hell and the vertical hold green correct already the picture by replacing G200 in 60 Hz to 60 Hz: electrically capacitor located by video and instruction. I used a computer (copying) capacitor (because my nearest computer supplier is over 100 miles away).

Bob Colverson

- 2) Diamond wire Falcon
 - 3) Locate the three Mark, indicator is leading to the monitor part
 - 4) Remove all three indicators from the Falcon PCB
 - 5) Replace the indicators with Nikon 1000000
 - 6) Reassemble your Falcon
- Five points, no VGA sync problems ever again! Oh, wrap the indicators. They can be useful for other mods.

David Little BSC

Reboot choice

Q I've just accidentally deleted 8800 files from my G200 drive using Reboot! I wish I'd read that doing more carefully! Has anyone had any experience of deleting sensitive programs?

Mr. Jerry - status conference, UK

A I've done the very same thing with Reboot! The problem was most sensitive sensitive utilities in they said it under erases of the data.

If you reformat your disk recently your chances of a complete salvage are improved. Typically sensitive utilities cannot all be removed. Leaving this to read the following steps to improve procedure is worth following:

- Define anything which is less than or equal to one cluster (typically 1024 bytes, but can vary with partition size). These files cannot be happened as the only task is to identify previously deleted files which had been overwritten with something else. (Remember, an usually a 1024 bytes)
- Next, identify files which are lost. Ready to be happened. For example, the deleted files were not in the file (before anything was deleted) or files written prior to the last delete session.
- This leaves the which step to be happened. Naturally sensitive utilities will not be able to recover them because they cannot not enough contiguous disk space starting from the start cluster. (Leaving these small lost makes it rather tedious these files around the gaps left before the files already recovered).

Identifying fragmented files back together takes power. I use the Reboot! disk editor and after looking at enough files you'll learn to recognize the end clusters, which is some guess work and have located the data. (Focus points and the last byte may well be a null byte, both good techniques you've got the right picture. Backing-up files is a real pain because they may be

Switch to hard

Q I regularly monitor printing times when I should run my Macintosh as fast and all but no save damage to it. Is this correct?
A.B. ALLEN, Surrey

A There are various reasons for this line of reasoning:
■ On start-up the ST pulls all its parts to discover what a connected and all peripherals need to be installed so that it be effective. The most common evidence for this was with the original Desktop printers which would not be found by the ST if they were switched on second.

■ There is a risk of a power surge from any sort of peripheral when they are switched on that may blow the port on the ST that it is connected to.

Turning on the peripherals last means that the ST remains safe.
Despite the above reasons they don't seem to go away with everything everything on and off at the wall socket. You might choose to do that but I wouldn't possibly recommend it.

Barry Roberts

UDD Backup'91

Q I've tried the UDD to HD, compression and finally I am disappointed. The number of HTM files created must be a good heavy code software etc. creates a separate HTM file.

The World Location

A Since UDD v3 new commands have been added to upgrade this situation. Furthermore you can tell UDD via Resource how to make a file containing a chapter HDG is also available for CDROM/Windows on the PC and Linux. Windows will now be available on the Mac and Amiga platforms.

David Roberts

World Wide

Q I've just started using the Internet and I have been travelling the many software services available. I understood that software online is compressed and we need to use the

appropriate de-compressing once the file is downloaded. However I have been totally changed by the MPA extension that some files have. What is this and how do I use these files?

John Newman, via email

A MPA stands for Mega-Stream Archive which is a way of compressing whole floppy disks (including their boot sectors) into one file. Mega-Stream Archive is version v3.3 and lets you compress those files usually creating smaller floppy disks in addition to creating new MPA files. Make sure you have a MPA file for MPA file to hand when you come to extracting them.

David Roberts

Atari on the move

Q I have had to sell an unwanted Atari and have a portable PC. I would still like to use Atari programs. What options are open to me?
Tony Roberts via the Internet

A You have three options. One is a software version of the Converter available for Windows 3.11 and above. This needs a copy of MagiC v4.0 or v4.1 on the operating system. Converter is available from Iron Fox. Disk convert -440/112-049 5290. Alternatively you may go directly for MagiC PC, the MagiC operating system for Windows95. For more details contact System Solutions on 044 22401 850 3385. The third option is TOXICITY for Windows 95 and Windows NT from AWT in Germany. This is a software emulator and currently only available in Germany. If you have access to the Web, point your browser to <http://www.awt.com>.

David Roberts

Atari PS Data

Q I have a PC running Internet with access to the Internet. I have an Atari 586 ST with a HD and RAM and would like my friend to download some games from the Atari website online. He mentioned that the Atari disk format is different to the PC one and that he would use KAPRIS (this program should write to the disk sector by sector - ignoring the current format) which is distributed with many Linux installations. This is getting a lot less installed on our PCs using GARFITE work or are there any alternatives?

P. Roy, Leicester

A He need to go to all the trouble. Simply use standard 3.5" Double density floppy disks formatted to 1000 on a PC. The ST is capable of reading 7" floppy disks (1000 disks) on you can just copy the files straight onto the floppy like normal files.

David Roberts

The Atari Portfolio the really Portable personal Computer...

For the amazingly compact 80386 based Portfolio, it's worth a visit to its on your hand - yet is powerful enough to offer you facilities you'd expect to find only on a full sized desktop or notebook. It will work for up to 10 hours on three AA batteries, allow you to copy, spread, merge, replace, store (and for portability) - the Portfolio works in 4 languages, English, French & German. Comes complete with a built in 386 coprocessor installed as 80386.

They are

Logic 1.33 compatible spreadsheet Full text editor-Calculator Address book-Photo editor Appointment Diary
With additional features, such as software the Portfolio can easily be converted to your OS, PC or Apple Mac for file & data transfer. We offer not only Portfolio hardware, but also a wide range of software & peripherals for you to get even more from the really Portable PC...

SCORPIONRY

The Art of Mastering the FALCON

Afterburner

The old video AWE Falcon accelerator can produce an average speed increase of at least 8 times a standard Falcon. (paid well over 5 times when used with Nemesis)

- 480486 processor - 14.5/32/64kbit/s
- 256K/512Kbit/s with Memoset
- 8Mbit expansion up to 64Mbit
- Expansion through port
- High level of software compatibility

Afterburner retains an extremely high level of compatibility by using existing Falcon software. Utilising the APEX card and Cubase Audio.

Now available in Black Edition a 480486/486 Turbo (48/60) which provides a full range of options for reducing mass memory performance. AfterburnerD40 £6999 ("new price")

Expose

The most popular video digitiser. Allows high resolution true colour real time image capture direct from VCR as convenient

- Capture stills up to 1024x768, 24 bit
- Automations up to 256x160 @ 17fps
- 256pa expansion to capture 1024x1024

Includes FullCUBE Tripod, FullCUBE & VGA/TV Expose £279.00

Falcon 14MB

Our 14MB Falcon upgrade is supplied for every Memoset. No additional supply replaces your existing memory board

Low price

APEX Media

The incredible animation program that took the Falcon market by storm. Now being shipped on CD. Having full compatibility with AfterburnerD40. A new version of APEX Media (available soon) now offers 640x480 true colour operation with Memoset!

What more can be said about the most advanced program for the Atari Falcon? APEX Media £99.00

BSS Debug

The essential utility for dedicated Falcon programmers. A host of features. BSS Debug £39.95

All prices include VAT 1600. Prices and specifications are change without prior notice

C-Lab MK.X Case

Superb replacement (sliding) case for the Falcon. An essential accessory and ideal for housing the Afterburner!

Price: £199.00

See our advert elsewhere in this issue for details on Nemesis & Vidality

APEX Alpha

Showing image processing highlights with the ultimate real-time Windows system. delivers up an unbelievable level of performance

- Full 24 bit real time image editing
- Real time access to any level of detail
- Any sized (256x256) real time block operation
- Real time Alpha channelled mask & paste operations (16 bit masking)
- Windows style on products and masks
- Adaptive channel key range masking
- Compound (multiple) drawing using a real time brush

With Memoset and Vidality APEX Alpha provides real-time use of 1024x1024 in 16 bit true colour on standard VGA monitors

APEX Audio

Since APEX development the professional audio users have long had wonderful editing and manipulation and DSD recording

- Extremely fast real time DSP operations
- Full 24 bit sampling capability
- Waveform enhancement technology for high quality audio
- Real time record and playback resampling at any sample rate from 44K to 192K
- Direct to DSD sampling
- Real filtering functions
- Waveform generation Studio

Please Note
APEX Audio and APEX Alpha
are currently under development
